

There are more than **290 steps** from the **base** of the Campanile to the **top** of the bell chamber

◁ THE CAMPANILE

The upper floors of the Campanile were built with one side taller than the other to compensate for the tilt.

△ UNIQUE CLUSTER

The Baptistery (left), Duomo (center), and Campanile (right) form an ensemble in the Piazza del Duomo regarded as the prime expression of the architectural style known as Pisan Romanesque.

CORRECTING THE TILT

By the late 20th century, the Campanile, tilting at an angle of 5.5 degrees, was in danger of toppling, despite earlier attempts at restoration. Remedial work began in 1992. First, the tower was stabilized with cables and soil was excavated from beneath its raised side to reduce the lean to less than 4 degrees, enough to stabilize the structure, without removing the tilt for which it had become so renowned.
