

◀ **TEMPLE OF AMUN, KARNAK**

Egyptian monumental structures—such as obelisks, pylons, and colossi—can still be seen at many religious complexes, and many of them are aligned with celestial landmarks. The temples at Karnak (see pp.210–211), near Luxor, are some of the most impressive surviving examples. The Temple of Amun is aligned with the winter solstice sunrise.

△ **WALL RELIEF**

Reliefs are shallow sculptures that remain attached to a background surface. Usually painted and utilizing a symbolic and figurative visual language, they are one of the most distinctive features of Egyptian architecture.

△ **ENTRANCE PYLON**

A pylon is a monumental gateway to a temple. It comprises a central aperture flanked by two taller, massive towers, which taper toward their flat tops. Pylons had important ceremonial functions and often featured depictions of pharaohs and deities.

PYRAMID OF DJOSER 205 FT (62 M)	BENT PYRAMID 344 FT (104 M)	GREAT PYRAMID OF GIZA 456 FT (139 M)

PYRAMID SHAPES

Pyramids are burial monuments for pharaohs. The Great Pyramids of Giza have smooth, sloping sides; in others, the slopes may change angle or take the form of pronounced steps.

456 ft (139 m) high, the **Great Pyramid of Giza** was the **tallest building in the world** until 1300 CE
