INDUSTRIAL AGE

The Industrial Age saw the transition from hand production to a world where almost all goods and materials were made by machine—one of the most transformative events in human history.

Architecture is arguably the most visible manifestation of the profound social, economic, and political changes of the Industrial Age. The industrial production of materials such as iron and glass allowed the creation of buildings and structures that simply would not have been possible before. More important, however, were the new types of building and infrastructure that these new materials allowed and which industry demanded. With the new wealth that industry created came new civic and municipal buildings. New bridges, train stations, sewage systems, factories, industrial buildings, and workers' housing all fundamentally changed the cities and landscapes in which they were built.

In terms of appearance, the stern Neo-Classicism of the late 18th and early 20th centuries gave way to a range of styles. Of these, Neo-Gothic was the most prevalent. It quickly became a feature of a range of structures, from hotels to government buildings.

GLASS, STEEL, AND STONE

△ CURVED GLASS

The 19th century saw significant advances in glass making. The most dramatic use of large panes was seen in the advent of structures where glass was inserted into iron frames.

△ STEEL FRAMES

In the late 19th century, steel became available as a building material. Buildings with a structural steel frame no longer required walls for the purpose of load-bearing.

△ STONEWORK

In a steel-framed building, walls function essentially as cladding. This allows for more windows and for stonework to become decorative rather than structural.

△ SUSPENSION CABLE

The development of wire rope in the mid-19th century was vital in making suspension bridges of the scale of the Brooklyn Bridge. Formed from multiple strands of metal twisted together, wire rope was far stronger and much more durable than the metal chain links used previously.

Although now nearly **150 years old**, the Brooklyn Bridge still carries over **100,000 vehicles every day**
