

▼ **BROOKLYN BRIDGE**

Begun in 1869, Brooklyn Bridge (see pp.26-27) is a cable-stayed suspension bridge and the first to use steel rather than iron wires. The central span of 1,595 ft (486 m) is supported by cables attached from the two stone towers sunk deep into the bed of New York's East River.

△ **RIVETS AND BOLTS**

Rivets became especially important during the Industrial Age, when they were used for joining large pieces of metal in frames or structures—a function subsequently taken on by bolts.
