

△ FINAL POUR

This photograph was taken after the last concrete was poured on top of the tower on February 22, 1974. Since work began just over a year earlier, 1,532 people had worked to continually pour the concrete.

◁ PANORAMIC VIEW

Rising 1,135 ft (346 m) above the tallest neighboring buildings, the CN Tower affords uninterrupted views of Toronto and Lake Ontario. On a clear day, it is even possible to see Niagara Falls.

CN Tower

The most prominent landmark on the Toronto skyline, and in its day the tallest structure on the planet

In 1968, the Canadian National (CN) railway built a communications and transmission tower to serve the Toronto area and as a symbol of its corporate vision. Work started in 1973 and was completed in 1976. The resulting tower measures 1,814 ft (553 m) from the ground to the tip of its antenna—tall enough to make it the world's highest tower until 2009, when it was overtaken by both the Burj Khalifa in Dubai (see p.310) and the Canton Tower in Guangzhou.

Up in the skies

The main column of the tower consists of a hollow, concrete, hexagonal pillar containing stairwells and services. The tower was built using a hydraulically

raised slipform metal platform, which slowly moved upward at a rate of about 19 ft (6 m) a day, continually pouring new concrete as it rose above the just-set concrete below. In total, the tower contains 1.4 million cubic ft (40,500 cubic m) of concrete, all of which was mixed on site to ensure that it was of the correct consistency. To check that the tower was vertical, plumb lines were dropped from the slipform platform and observed by instruments on the ground.

On top of the column is a 335-ft- (102-m-) high metal broadcast antenna. Six glass-lined elevators located in the tower's outer supports take visitors to observation areas, although the glass floor and the outdoor observation deck are not for the faint-hearted.

VIEWING AREAS

The public areas of the CN Tower are in two parts. The upper SkyPod sits just below the antenna at 1,465 ft (446.5 m). The lower LookOut Level, toward the tip of the main column, is at 1,122 ft (342 m); it has two observation decks and a revolving restaurant, as well as the tower's microwave receivers.

The CN Tower's **revolving 360 Restaurant** makes one full rotation **every 72 minutes**
