

Wind puts a greater **load** on many modern **high-rise buildings** than the actual **weight** of the structure

▷ **ENERGY-EFFICIENT GLASS**

Contemporary buildings are often designed with glass exteriors that can lead to overheating. Energy-efficient glass reduces the interior temperature gain and thereby the need for costly, energy-consuming air conditioning.

▷ **CURTAIN WALL**

A curtain wall facade does not carry any structural load from the building, as the weight is carried by the internal frame. However, spanning multiple floors, it can withstand forces acting upon the structure, such as high winds and seismic activity.

△ **INDOOR PLANTS**

Bringing vegetation such as low-maintenance plants indoors has many energy-efficient benefits. Just a few planters and flowerbeds can help balance humidity levels, absorb sounds, and remove pollutants from the air. The inclusion of greenery is also thought to reduce anxiety.

IRREGULAR FORMS

Advances in building technology, coupled with computer-aided design and building modeling, allow today's architects to design buildings in almost any form and actually be able to build them.
