

△ ACROTHERION

An acroterion is an architectural ornament positioned at the apex of a pediment. It takes a variety of forms such as a palmette (a decorative form derived from a palm leaf), urn, or even figurative sculpture.

CLASSICAL COLUMNS

△ TUSCAN

Codified by Renaissance Italians, the Tuscan is, in effect, a simplified form of the Doric. It has a smooth column and a plain capital and base.

△ DORIC

The Doric is the earliest and simplest of the Classical orders, having a fluted column without a base. The decorative elements are in the frieze.

△ IONIC

The Ionic is characterized by the volutes (scrolls) of its capitals and its thin, fluted columns. It was used extensively by the Romans.

△ COMPOSITE

A Roman invention, the Composite combines the volutes of the Ionic with the acanthus leaves of the Corinthian on its capital.

△ CORINTHIAN

The Corinthian is the most ornate, reserved for important buildings. Its capitals are decorated with the leaves of the acanthus plant.
