

**POWERFUL
BITE FORCE**

STATS AND FACTS

Didelphodon belonged to a group of mammals called metatherians, which includes the marsupials (mammals with a pouch for their young) and related mammals.

WEIGHT

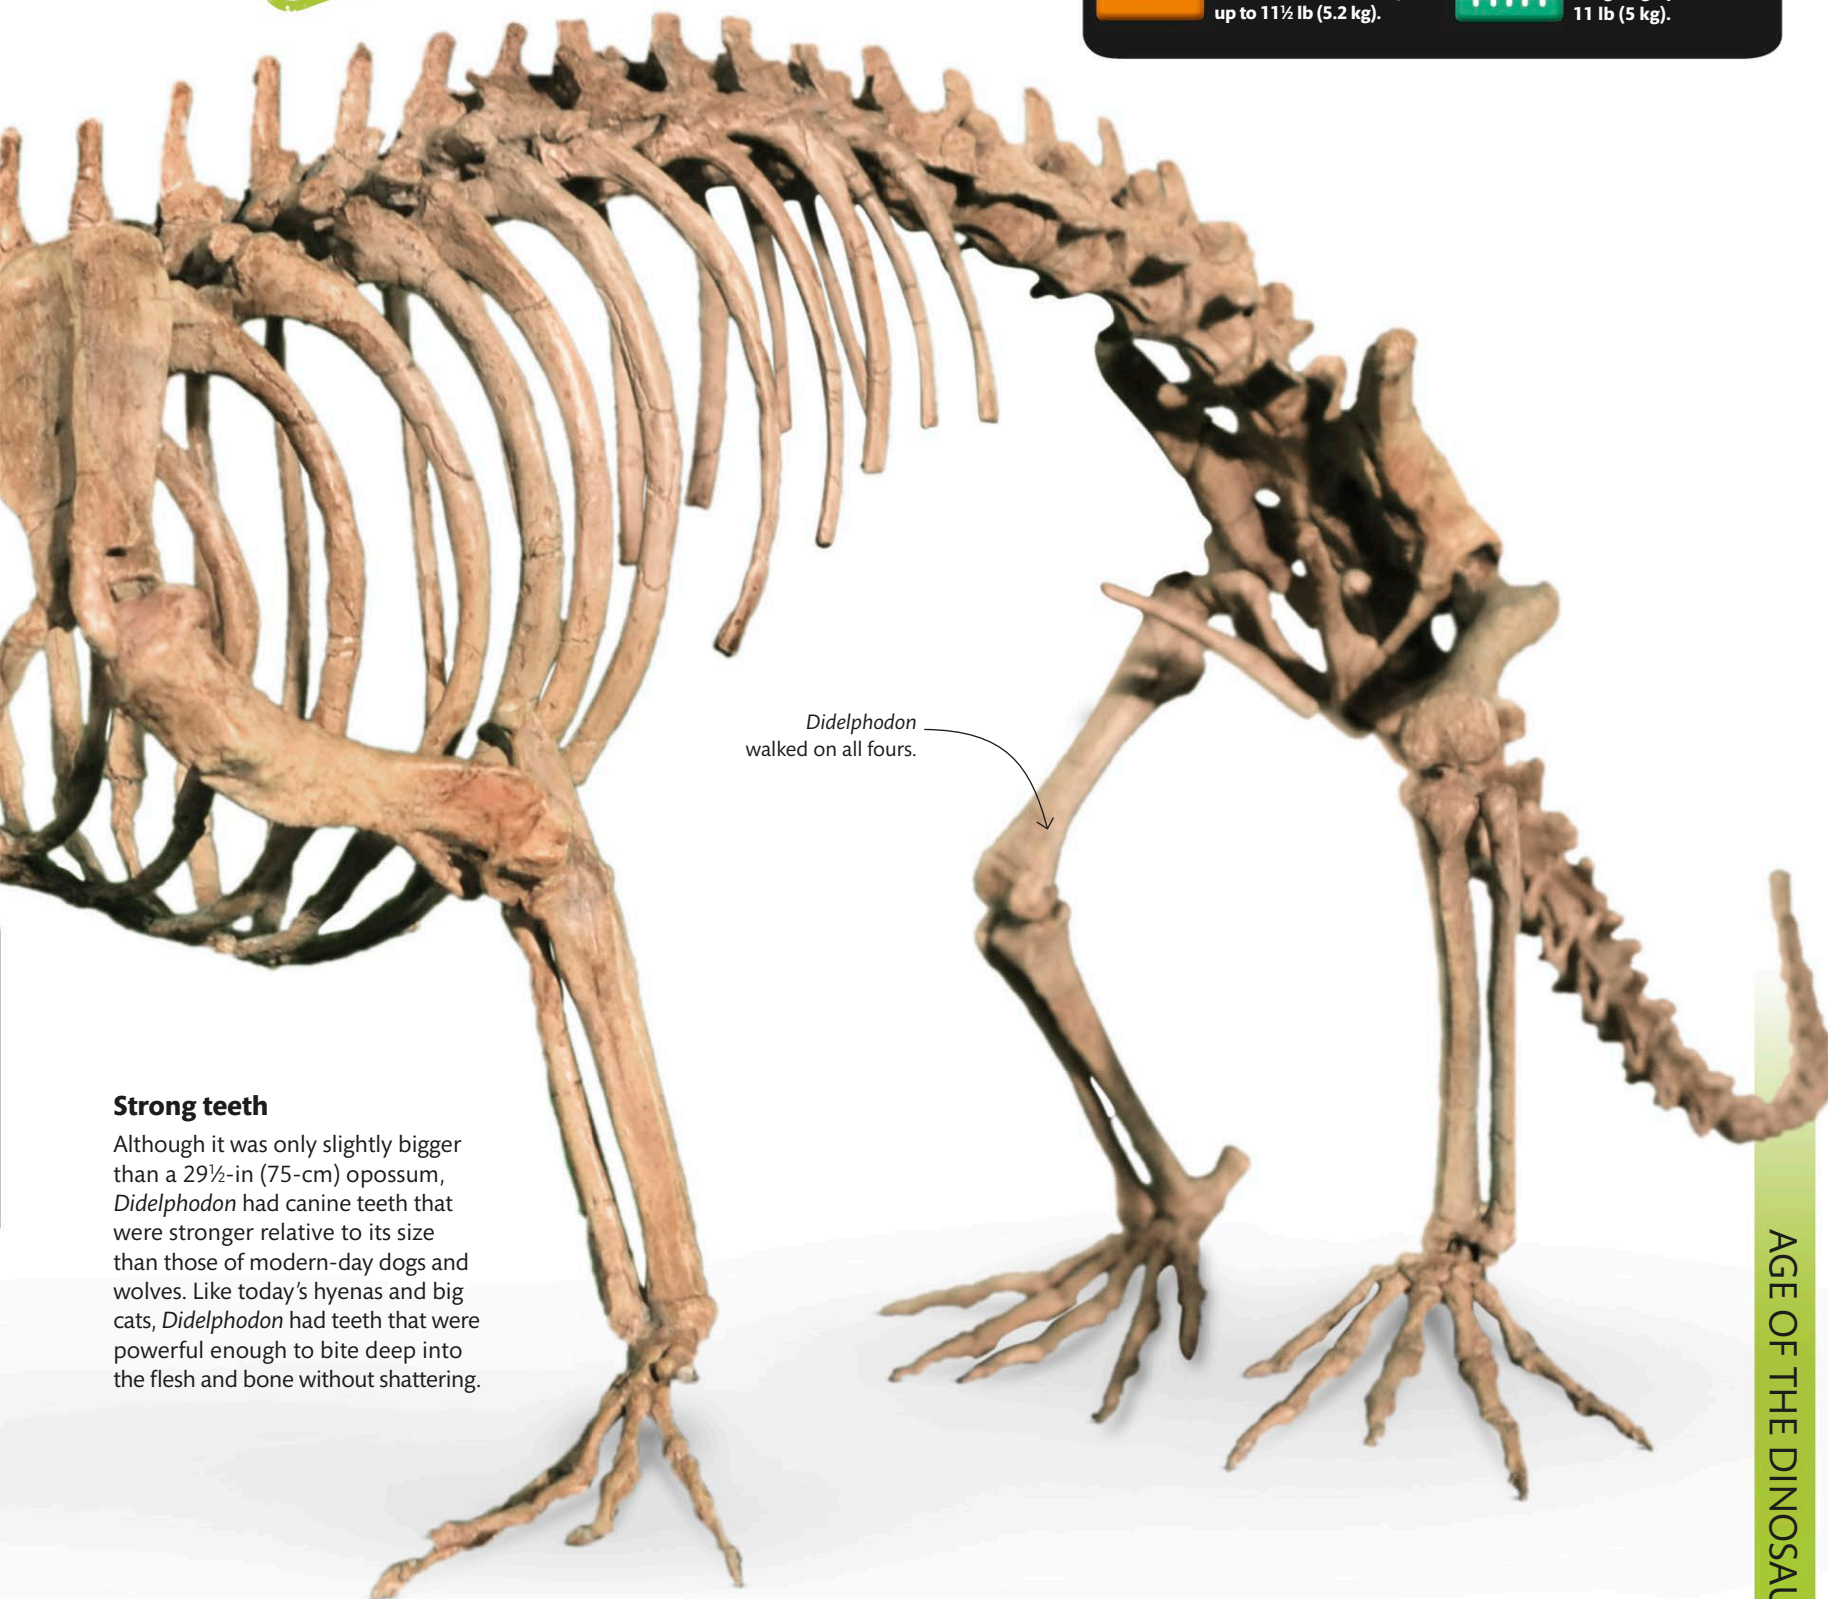

Didelphodon young probably weighed around 5½ lb (2.5 kg), while adults could weigh up to 11½ lb (5.2 kg).

PREY SIZE

An adult *Didelphodon* could probably attack and kill prey weighing up to 11 lb (5 kg).

Strong teeth

Although it was only slightly bigger than a 29½-in (75-cm) opossum, *Didelphodon* had canine teeth that were stronger relative to its size than those of modern-day dogs and wolves. Like today's hyenas and big cats, *Didelphodon* had teeth that were powerful enough to bite deep into the flesh and bone without shattering.
