

LARGEST DINOSAUR

Conifers probably made up a large portion of *Argentinosaurus*'s diet.

A baby *Argentinosaurus* was so small that it could easily get crushed under a fully grown adult's feet.

STATS AND FACTS

Argentinosaurus probably ate up to 500 lb (230 kg) of food every day. The largest herbivore alive today, the African savanna elephant, only eats 300 lb (136 kg) of food in a day.

SPEED

mph

kph

The top walking speed of *Argentinosaurus* was probably 5 mph (8 kph).

A human walks at an average speed of 3½ mph (5.6 kph).

LENGTH OF THIGH BONE

8 FT
(2.5 M)

Small start

Several nesting sites containing the fossilized eggs of sauropods such as *Argentinosaurus* have been discovered in Argentina. They reveal that *Argentinosaurus* hatchlings were quite small, but that they grew rapidly. However, the babies probably received no parental care and had to fend for themselves from the moment they hatched.
