(45 KG)

WEIGHT OF THE ANTLERS

STATS AND FACTS

LIGHTWEIGHT SKULL

Although *Megaloceros* had large antlers, its skull was very light, weighing only 4½ lb (2 kg).

WEIGHT

Megaloceros males may have been at their heaviest during mating season, weighing around 1,323 lb (600 kg).

The largest *Megaloceros* antlers measured up to 13 ft (4 m) across, which is twice the length of the antlers of a bull moose, the largest modern-day deer.

Eyes on the side of *Megaloceros*'s head gave it a full view of its surroundings and any potential predators.

Spines on *Megaloceros*'s shoulder anchored strong neck muscles that helped support the weight of its antlers.

Megaloceros's long limbs allowed it to run long distances across the open grasslands it inhabited.

**LARGEST
ANTLERS**

A detailed illustration of a Megaloceros skeleton, showing the skull with large antlers, the ribcage, and the long limbs. The skeleton is mounted on a white background with various callouts and a stats box.
