

Ancient bone bed

This fossil was found in Dinosaur Provincial Park, a famous location in Alberta, Canada, that is littered with the fossils of more than 50 dinosaur species. These fossils belong to animals that lived between 77 and 75.5 million years ago, and the specimens range from ornithomimids (such as this one) to hadrosaurs and ankylosaurs.

A long, slender neck helped *Struthiomimus* reach tall plants.

Struthiomimus's long arms would have been covered with feathers.

STRUTHIOMIMUS
