

AT A GLANCE

- **LENGTH** 35½ in (90 cm)
- **DIET** Carnivore
- **LIVED** 443–416 MYA
- **HABITAT** Uncertain

**LARGEST
SCORPION**

Brontoscorpio's tail was probably made up of segments.

Venom factories

Scorpion venom can attack the nervous system, muscles, and heart of a victim. *Brontoscorpio* was five times larger than modern-day scorpions, so it may have carried more venom, giving its sting a real punch. However, scorpions have been evolving for more than 418 million years, so *Brontoscorpio's* venom might have been very different from that of its descendants.

Brontoscorpio may have had tiny, sensitive body hairs that helped it sense its environment.
