

A detailed illustration of a Prionosuchus, a prehistoric aquatic predator, swimming in clear blue water. The dinosaur has a long, narrow snout filled with sharp, green-tinted teeth. Its body is dark green with lighter green stripes along its back. A small, dark fish is visible in the lower left, and a large, mossy log lies on the bottom. The text is overlaid in the upper right quadrant.

Prionosuchus's
5-ft (1.6-m) long
skull was *twice the*
size of a modern-
day gharial's.

AQUATIC PREDATOR

Prionosuchus's thigh bones were only 5 in (13 cm) long, which suggests that its legs may not have been much help on land. However, it had webbed feet, which when combined with a strong tail would have allowed it to propel itself through the water with ease.
