

Deadly claw

Dakotaraptor had a 9½-in (24-cm) long claw on its second toe, which it probably used to grip and pin down prey. Its teeth then tore away at its victim's flesh.

AT A GLANCE

- **LENGTH** 18 ft (5.5 m)
- **DIET** Carnivore
- **LIVED** 70.6–66 MYA
- **HABITAT** Open plains

Dakotaraptor kept its long claw off the ground.

Dakotaraptor had a wrist bone that allowed it to fold its long hands back against its body.

Smaller toe claws

Research suggests that *Dakotaraptor* might have used its feathers to cover and protect its eggs.
