

A detailed illustration of a Nanuqsaurus, a small, furry, brown and grey dinosaur, standing in a snowy forest. The dinosaur is shown in profile, facing right, with its head slightly lowered. Its fur is thick and textured. The background consists of several tall, thin, snow-covered tree trunks. The ground is covered in a layer of snow, with some fallen branches and logs visible. A bright yellow-green stamp with a distressed, hand-painted look is positioned in the upper right corner. It contains the text 'SMALLEST TYRANNOSAURID' in bold, black, sans-serif capital letters. A thin black line points from the dinosaur's snout towards a circular callout box in the lower center of the image. The callout box has a light beige background with concentric circles and contains text about the dinosaur's discovery. To the right of the callout box, there is a small text block explaining the significance of the dinosaur's skull structure. At the bottom left, there is a section titled 'Polar predator' followed by a paragraph of text. On the far right, a vertical green bar contains the page title 'AGE OF THE DINOSAURS' and a circular page number '77' at the bottom.

**SMALLEST
TYRANNOSAURID**

Nanuqsaurus
was discovered
by accident at
the dig site for
another dinosaur.

Nanuqsaurus's skull shows that the area of its brain that dealt with smell was large, which means that it probably depended on that sense for hunting.

Polar predator

Stalking through the icy forests of the far north, *Nanuqsaurus* faced a struggle to survive. These hunters probably fed on the young of large herbivores in its habitat such as the horned *Pachyrhinosaurus* and a hadrosaur called *Ugrunaaluk*. The slim pickings wouldn't have provided much energy, which may have limited *Nanuqsaurus*'s size and prevented it from growing as large as its cousins in the south.
