

Fleshy display

A specimen belonging to one species of *Edmontosaurus* was found preserved with a small, fleshy crest on top of its head, similar to the modern-day cockerel's comb. Paleontologists think the crest may have been used as a display feature to attract mates.

STATS AND FACTS

Edmontosaurus lived in regions that would have experienced cold and dark winters. This led some researchers to suggest a few *Edmontosaurus* herds may have migrated south to escape the chill. However, recent studies have shown that they probably stayed put and faced the cold.

REARING UP

Edmontosaurus could rear up on its hind legs and stand at around 13 ft (4 m) tall in order to reach taller plants.

RUNNING SPEED

Paleontologists think that a young *Edmontosaurus* could reach speeds of 35 mph (57 kph).

Some *Edmontosaurus* fossils that still have large areas of skin intact show that the hadrosaur had small scales.
