

25µs, enabling blur-free inspection of fast-moving targets. It supports up to 100 simultaneous measurements, including diameter, width, height, and radius, as well as GD&T analysis. With repeatability down to $\pm 0.03\mu\text{m}$ and a field of view up to 120mm, the platform targets automotive, electronics, and medical manufacturing applications requiring high-speed quality control.

1000V handheld insulation tester

A 1000V handheld insulation tester has been introduced to support high-voltage diagnostics and routine electrical maintenance in field environments. The portable instrument combines insulation-resistance testing with full digital multimeter functionality, allowing technicians to perform multiple electrical measurements with a single device. Developed by KUSAM-MECO, the tester measures insulation resistance up to $20\text{G}\Omega$ and offers selectable DC test voltages from 50V to 1000V. It also provides real-time high-voltage indication and supports polarisation index (PI) and dielectric absorption ratio (DAR) diagnostics.

AI-RAN digital twin testbed

An AI-RAN digital twin testbed has been introduced to enable system-level validation of next-generation wireless networks inside the laboratory. The platform allows researchers to test AI-driven radio access network features under realistic propagation conditions without field trials. Engineered with hardware-in-the-loop testing tools, the platform supports AI-based link adaptation and closed-loop RF validation, helping

to accelerate the development of 5G-Advanced and early 6G network technologies.

MISCELLANEOUS

Linux-based edge computing platform

Kvaser has introduced Kvaser Edge, a Linux-based edge computing platform that enables real-time data process-

ing directly on vehicles, machinery, or test benches. The system

runs on an ARM-based computer with an integrated secure element for hardware-level data protection and supports real-time filtering, aggregation, and anomaly detection to capture only relevant operational data. Optional GPS enables fleet tracking and location-aware monitoring. The solution is designed for automotive-grade power conditions and supports diagnostics, predictive maintenance, and event-based logging.

Megawatt flash-charging system

BYD has unveiled a megawatt flash-charging system for its Blade battery technology, enabling electric vehicles to recharge dramatically faster than

conventional systems. The platform delivers up to 1MW charging power using a 1000V architecture and 1000A current,

allowing compatible EVs to gain around 400km driving range in about 5 minutes. Developed by engineers at BYD as part of its Super e-Platform, the system combines a flash-charging battery with silicon-carbide power chips and liquid-cooled charging infrastructure to handle ultra-high power

safely. The technology aims to reduce EV charging time to near refuelling speeds, potentially easing charging-anxiety barriers to wider electric-vehicle adoption.

In-vehicle 5G router

Ericsson has introduced the Cradlepoint R2400, an in-vehicle 5G router designed to deliver mission-critical connectivity for public safety, trans-

sit, and fleet operations. The system features ultra-fast dual-SIM

failover, enabling carrier switching up to ten times faster than conventional methods to maintain uninterrupted voice, video, and data services. It also integrates Wi-Fi 7, edge AI processing, and RTK-based positioning that improves location accuracy from metre-level to about one centimetre. Developed by Ericsson's networking teams, the platform supports 5G standalone Release 17 and network slicing, enabling reliable real-time applications such as connected vehicles, live video streaming, and autonomous operations.

Edge AI platform

A new edge-first artificial intelligence platform designed to run AI workloads directly on-site has been introduced to help industries deploy real-time intelligence without relying on cloud infrastructure.

The system integrates industrial AI software with

GPU-accelerated computing to enable low-latency processing and protect sensitive operational data. The platform is designed to improve productivity, enable predictive maintenance, and enhance safety monitoring in industrial settings.
