

EDUCATION:

India's First Step

Towards the #1 Economy

For India, education is not optional. It is the decisive step toward becoming the top economy.

JANARDHANA SWAMY is an electronics engineer, inventor with patents in India and the USA, and a former Member of Parliament from Chitradurga. This series draws on his rare blend of technical depth, global experience, and lifelong passion for India's leadership.

Education is the foundation of a leading economy. Every sector is built by people, and their potential is shaped years before they enter the workforce. Education determines how a nation thinks and what it is capable of building. India has expanded access and built Centres of Excellence. The next step is alignment at scale.

A nation of contrasts

India shows two very different pictures. On one side, there are institutions producing world-class graduates. On the other hand, there are schools where even basic learning is not complete. Access to education has increased across the country, but learning quality remains uneven. While some students reach global standards, a much larger number do not achieve their full potential. This gap is visible in outcomes. Industry struggles to find the right skills, and many students struggle to

find the right opportunities. For India to grow at scale, quality education must reach everyone, not just a few (see Table 1).

One nation, one education

India's diversity is a strength. It becomes a real capability only when the foundation is consistent. Today, multiple boards and varying evaluation systems create uneven outcomes. A student's capability should not depend on geography. A common national baseline in mathematics, science, and analytical skills changes this. One Nation, One Education ensures:

- Comparable academic rigour
- Seamless student mobility
- Equal access to foundational quality

Flexibility remains where it belongs, in language, electives, and

specialisation. The fundamentals must be aligned. When the foundation is consistent, diversity scales as strength.

English: The technical passport

India's linguistic richness is a strength. Education requires clarity of purpose. Science, engineering, medicine, and global collaboration operate predominantly in English.

Every student must learn English well alongside regional languages. India has always been multilingual, and learning multiple languages is an advantage. English provides access to global knowledge. Regional languages provide cultural depth and identity. Both strengthen the learner. Weak proficiency in English quietly limits opportunity. Many students hesitate to participate, even when they understand the subject. A strong and early foundation in English removes this barrier.

Students can then focus on concepts. When students are fluent in English and grounded in their regional language, they gain confidence and engage fully with advanced learning.

Maths: A language of nature

Mathematics sits at the heart of science,

TABLE 1
A SWOT ANALYSIS OF EDUCATION

Strengths	Weaknesses
• Young, working-age population with long-term demographic advantage • Proven capability in building population-scale digital systems • Strong global presence of Indian talent in technology and research	• Quality disparity across regions • Continued dependence on rote learning • Limited research and development investment
Opportunities	Threats
• One Nation, One Education for consistent national standards • Bilingual capability combining Indian languages with English • Mission Maths to strengthen analytical capability	• Industry is not ready for STEM graduates • Concentration in services without sufficient deep-tech expansion • Infrastructure gaps affecting learning environments
