Java card-based security key

Infineon Technologies has introduced the SECORA ID Key S USB, a Java card-based security key supporting USB and NFC for password-less authentication, digital signatures and phishing-resistant access. As the first FIDO Level 3+ certified key compliant with CTAP 2.1, it enhances identity security for enterprises, financial institutions, and government organisations. Its compact system-in-package design simplifies OEM integration while enabling secure key management, encrypted communication, and flexible identity-based applications.

Memory on package

AMD has unveiled the AMD Versal premium Gen 2 memory on package (MoP) adaptive SoCs. Designed for physical AI, networking, aerospace, defence, test and measurement, and professional video applications, the devices combine compact form factors with high-speed connectivity and long-term reliability. Built-in security features, including memory encryption and PCIe data protection, safeguard critical workloads. The SoCs also support scalable memory architectures, enabling efficient deployment in data-intensive enterprise, industrial, and secure communications systems.

Programmable clock generator

Microchip Technology has introduced the DSA504RT radiation-tolerant programmable clock generator, designed to simplify timing architectures in spacecraft and defence electronics. Intended for navigation, communications, and scientific payloads, it helps reduce board space, power consumption, and system complexity while improving reliability. Supporting multiple output standards with ultra-low jitter, the DSA504RT enables precise synchronisation in space environments where dependable timing is critical, and satellite navigation signals may be unavailable.

650V GaN power switch

Nexperia has expanded its 650V gallium nitride (GaN) FET portfolio with new on-resistance options and industry-standard package variants. Designed for AI data centre power supplies, telecom infrastructure, renewable energy, battery energy storage systems, and industrial automation, the devices support higher switching frequencies with lower power losses. The expanded range enables designers to balance efficiency, thermal performance, and board space while improving power density and reducing cooling requirements, offering a compact alternative to conventional silicon-based power conversion solutions.

Surface-mount MOSFETs

ROHM has introduced the R60xxXNx series and PrestoMOS R60xxWNx series of 600V Super Junction MOSFETs.

Targeting AI server power supplies, industrial power systems, motor drives, and inverter applications, the devices improve thermal performance and reduce switching losses while supporting higher power density. Their industry-standard package footprints and conventional gate threshold simplify integration into existing designs and enable drop-in replacement, helping manufacturers enhance supply chain flexibility while developing more compact and efficient power electronics.

Capacitors

TAIYO YUDEN has launched the HVX (-K) and HTX (-K) series of conductive polymer hybrid aluminium electrolytic capacitors for automotive power supply

circuits. Qualified to the AEC-Q200 standard, the capacitors are designed for electric power steering, ADAS, electric vehicles, and other vehicle control systems. Combining low equivalent series resistance with the self-healing characteristics of aluminium electrolytic technology, they improve power stability, suppress electrical noise, and enhance long-term reliability.

Automotive optocoupler

Vishay Intertechnology has introduced the VOMHA43A, an automotive-grade
