

high-speed optocoupler designed for isolated data communication and signal switching in automotive and

industrial systems. Housed in a compact SOP-5 package, the device combines

high isolation capability with strong immunity to electrical transients, making it suitable for EV battery systems, communication buses, and intelligent power module drivers. Pin-to-pin compatibility with existing solutions simplifies upgrades without redesign, while its compact footprint helps reduce PCB space in space-constrained electronic designs.

Non-volatile memory family

GigaDevice has introduced the GD24CL series I²C EEPROM, a non-volatile memory family designed for industrial, IoT, energy, data centre, and networking applications. The devices provide reliable long-term storage for configura-

tion and system data while integrating hardware-based security features and low-power operation. Built-in error correction enhances data integrity, while write protection and a lockable security page safeguard critical information.

CAN-based air quality sensor

Metis Engineering has introduced the Air Wise air quality sensor, a CAN-based multi-parameter monitoring solution for connected vehicles and industrial environments. The sensor continuously measures key air quality indicators, including CO₂, NO_x, VOCs, temperature, and humidity, enabling intelligent HVAC control and automated environmental management. Designed for automotive, commercial

vehicle, and industrial applications, Air Wise simplifies system integration while helping improve occupant safety, ventilation efficiency, and regulatory compliance.

Three-channel digital isolators

NOVOSENSE has introduced the SP301H/L series of three-channel

digital isolators, integrating RS485 communication isolation into a single chip to simplify circuit design and improve reliability. Designed for electric vehicles, energy storage, solar systems, industrial automation, and AI server power supplies, the isolators provide reinforced electrical isolation, strong immunity to electrical noise, and stable communication in demanding industrial environments.

Compact relay series

Panasonic Industry has introduced the HE-S SC relay series, including the HE-S SC 2a and HE-S SC 2a1b models, for single-phase EV charging systems and wall-box applications.

An integrated mirror contact option supports diagnostic and functional safety features, while the PCB-mount form factor reduces system size and assembly complexity. The relays are well-suited for next-generation residential and commercial EV charging infrastructure.

Compact radar front-end module

Qorvo has introduced a compact X-band radar front-end module for phased array and multifunction defence radar systems. Designed for

active electronically scanned array (AESA) radar platforms, it maintains stable RF performance across varying antenna loads, helping extend detection capability

without increasing system size, weight, or power consumption, making it well-suited for next-generation high-performance radar applications.

Evaluation kit

u-blox has introduced the F11 GNSS product line, featuring the UBX-F11270-KB, UBX-F11170-CC, UBX-M11070-KB, MAX-M11N, and EVK-F112 evaluation kits to deliver accurate positioning with significantly lower power

consumption. Designed for wearables, drones, asset tracking, and micromobility, the F11 series also incorporates advanced firmware features such as multipath mitigation, spoofing detection, and over-the-air firmware updates for reliable navigation in challenging environments.

DC/DC converters

RECOM has introduced the REC6K-AW and REC6K-RW series of 6W regulated

DC/DC converters, designed for industrial automation, railway, energy, and embedded applications. Integrated protection functions enhance system reliability, while compact package options support both space-constrained and through-hole designs. With high isolation ratings and operation across a broad temperature range, the REC6K series delivers dependable power for demanding industrial environments.
