Power test platform

Caltest Instruments, a Pacific Power company in India, has introduced the AGX series, a regenerative AC and DC power test platform for validating

high-power systems across EV charging,

solar energy, AI data centres, and aerospace applications. The modular platform combines AC/DC sourcing, regenerative loading, and grid simulation in a single system, reducing test equipment requirements and improving laboratory efficiency. The AGX series also supports grid compliance testing for solar inverters, EVSE validation, and flexible power emulation for automated aerospace and defence test environments.

High-resolution oscilloscopes

Saelig Company, Inc. has introduced the Micsig MHO 6 series high-resolution oscilloscopes, combining eight analogue channels with 12-bit acquisition

for advanced electronic testing. Designed for embedded systems, power

electronics, industrial automation, and automotive applications, the oscilloscopes enable simultaneous monitoring of multiple signals, reducing debugging time, and improving measurement accuracy.

RF test platform

Emerson has introduced a new range of NI PXI hardware, including the NI PXIe-5108 oscilloscope, PXIe-1081 hybrid chassis, PXIe-8842/8862 embedded controllers, and PXIe-6381/6383 multifunction I/O modules,

to make advanced automated test systems more accessible. Designed for RF validation, semiconductor testing, aerospace, industrial automation, and

research, the modular platform enables synchronised, software-defined measurements with scalable expansion.

Integration with LabVIEW, InstrumentStudio, and TestStand streamlines test development, while high-channel-count acquisition and precision data measurement improve efficiency across complex validation and characterisation workflows.

Millimetre-wave inspection system

Rohde & Schwarz has introduced the R&S IMAGER, a real-time millimetre-wave inspection system that enables non-destructive inspection of sealed

packaged goods without using ionising radiation.

The system generates high-contrast 3D images by scanning through materials such as plastic, cardboard, and glass, allowing manufacturers to detect hidden defects and verify package contents. Designed for pharmaceutical, food, beverage, and logistics applications, it integrates with production lines and supports AI-based defect detection, helping improve quality control while maintaining high-speed manufacturing throughput.

3D automated X-ray inspection system

Test Research, Inc. (TRI) has intro-

duced the TR7600 SV series line-scan 3D automated X-ray inspection (AXI) system to improve inspection speed and

accuracy in electronics manufacturing. The system supports inspection of complex assemblies, including BGAs and system-in-package devices, while integrating with Industry 4.0 manufacturing environments through standard factory communication protocols, helping manufacturers enhance quality, productivity, and process automation.

Four-channel LIN interface

Kvaser has introduced the PCIe 4xLIN, a four-channel LIN interface for automotive communication testing, valida-

tion, and debugging. Designed for desktop, industrial,

and hardware-in-the-loop environments, the PCI Express card provides galvanically isolated LIN channels with synchronised timestamping for accurate event correlation across distributed ECUs. The interface helps engineers identify communication faults, verify synchronisation, and scale validation setups for increasingly complex vehicle electronics.

Radar level meter

HIKMICRO has introduced the LRG10 series radar level meter, an 80GHz

FCMW radar-based solution for continu-

ous level measurement in industrial tanks, silos, reservoirs, and pipelines. Designed to measure liquids, slurries, and bulk solids, the device delivers accurate readings in challenging conditions such as dust, steam, and corrosive environments. The LRG10 series is suited for water treatment, chemical, food, pharmaceutical, and bulk material handling applications.
