

## SNIPPETS

- Mitsubishi Chemical explores semiconductor investment in West Bengal
- Chennai Institute of Technology partners with Taiwan's NFU and AGEM for semiconductor research
- Intel-backed semiconductor startup Syntiant files to go public
- Rapidus and UKSC deepen Japan-UK semiconductor collaboration
- Nvidia AI hardware prices jump in China as export controls squeeze supply
- Oxmiq raises US\$35 million to develop licensable AI GPU chip technology
- TSMC and Amkor sign 10-year semiconductor packaging deal in Arizona and US
- Intel lays off 15% of workforce to sharpen focus on AI and foundry business
- OpenAI advances custom AI chip development with Broadcom to reduce Nvidia reliance

### Samsung commits nearly US\$1.94 trillion to South Korea's chip industry

Samsung Group has pledged ₩2655 trillion (about US\$1.94 trillion) in long-term investments under South Korea's new AI-led regional development strategy, replacing the earlier proposed ₩1000 trillion plan. The programme includes semiconductor, AI, and data centre projects, with ₩625 trillion earmarked for regional investments. The investment complements South Korea's US\$518 billion national semiconductor initiative, under which Samsung plans to build two new chip fabs with SK hynix.

### TSMC posts record Q2 profit, revenue rises to US\$40.2 billion

TSMC reported record second-quarter results, with revenue rising 36% YoY to NT\$1.27 trillion (US\$40.2 billion) and net profit expected to increase 59% to NT\$632.6 billion (US\$19.7 billion). Driven by demand for 3nm, 2nm, and CoWoS AI chips, the company is also expected to raise its 2026 revenue and capital expenditure forecasts.

### GlobalFoundries to acquire MIPS to strengthen AI and RISC-V portfolio

GlobalFoundries has agreed to acquire

processor IP company MIPS to expand its AI and RISC-V compute capabilities. The deal will add customisable processor IP, software, and AI technologies to its semiconductor portfolio, enabling faster chip development for automotive, industrial, data centre, and edge applications.

### Micron expands Japan fab with \$9.3 billion investment

Micron Technology will invest US\$9.3 billion to expand its Hiroshima semiconductor facility, boosting production of next-generation HBM chips for AI processors. Backed by up to US\$3.1 billion in Japanese government subsidies, the plant will begin shipments in 2028.

### Samsung Foundry wins AI chip orders, competition with TSMC intensifies

Samsung Foundry is gaining momentum in the AI semiconductor market after securing orders or entering advanced discussions with customers, including Nvidia, Google, Tesla, AMD, and BYD. The wins, driven by tight advanced-node capacity at TSMC, strengthen Samsung's foundry business and support its strategy to expand sub-5nm manufacturing for next-generation AI processors.

### DeepSeek reportedly develops an in-house AI chip to cut hardware dependence

China's DeepSeek is supposedly developing an in-house AI inference chip to reduce reliance on Nvidia and Huawei processors. The early-stage project involves partnerships with chip design, foundry, and memory firms, alongside semiconductor hiring. The custom silicon aims to lower inference costs, optimise AI performance, and strengthen supply chain resilience amid US export restrictions.

### Universal IP for 2nm chip designs

Silvaco Group has launched its Mixel MIPI C-PHY/D-PHY Combo Universal IP for TSMC's N2P process, enabling compact, power-efficient chips for

AR glasses, wearables, cameras, and mobile devices. Supporting the latest MIPI C-PHY and D-PHY standards, it integrates high-speed transmit and receive functions, reducing power consumption, chip area, EMI, heat, wiring complexity, and simplifying dense, high-bandwidth designs.

### Test system checks chiplets before packaging

Teradyne has launched an integrated known good device (KGD) screening test cell, developed with Tokyo Electron (TEL), combining its UltraFLEXplus platform with TEL's Prexa singulated device prober. The solution enables electrical testing and thermal management of individual dies before AI and data centre package assembly. Its open architecture supports multiple probing technologies, improving yield, reducing waste, simplifying deployment, and enhancing chiplet reliability.

### One platform for multiple chip design tasks

Synopsys has introduced its first Multiphysics Fusion solutions, combining AI-powered electronic design automation (EDA) tools with Ansys signoff analysis. The portfolio unifies signal integrity, power integrity, thermal, electromagnetic interference, and multi-die analysis in one workflow. Designed for AI, HPC, analogue, photonics, and advanced packaging, it improves predictability, accelerates design closure, reduces iterations, and speeds GPU-accelerated simulations.

### AI simplifies SoC verification

Breker Verification Systems has launched an AI-driven SoC verification solution combining its Trek Test Suite Synthesis platform with Moores Lab AI VerifAgent. It converts written chip specifications into executable C and SystemVerilog tests for simulation and hardware emulation, supporting multicore and transaction-level modelling. Designed for AI, automotive, networking, data centre, and consumer SoCs, it accelerates validation, improves reuse, and enhances coverage.
