Quantum processor

Microsoft has unveiled its Majorana 2 quantum processor, marking a major advance in quantum computing reliability. The company

says the new chip delivers dramatically more stable qubits through a redesigned topological architecture and an

upgraded superconducting materials stack, helping address one of the industry's biggest challenges, maintaining quantum states long enough for meaningful computation. The processor improves qubit coherence and measurement accuracy while supporting faster operations.

Ultra-compact GNSS antenna

Taoglas has launched the GVLB208 series, an ultra-compact dual-band GNSS antenna designed to deliver high-precision positioning in space-constrained devices. Optimised for major satellite constellations, it enhances positioning accuracy in challenging

RF environments and helps mitigate multipath interference. The compact antenna targets applications including autonomous robots, drones, telematics, fleet tracking, precision agriculture, and industrial IoT systems, enabling advanced navigation capabilities without increasing device size.

Single-chip automotive radar

NXP Semiconductors has introduced a single-chip automotive radar SoC

that combines sensing and perception processing, helping automakers reduce

system complexity, power consumption and integration costs while expanding

ADAS capabilities to mainstream vehicles. The solution enables on-sensor intelligence, reducing reliance on centralised compute platforms and simplifying vehicle electronics. Designed for applications such as adaptive cruise control, emergency braking, blind-spot detection, and parking assistance, the radar SoC supports multiple sensing ranges and includes interference mitigation technology.

Silicon-on-insulator RF control components

Qorvo has launched a family of silicon-on-insulator RF control components that eliminate the need for negative-voltage bias circuitry, simplifying high-frequency system design. With TTL-compatible control

and fast switching, it reduces board complexity and component count. Targeted at defence, aerospace, satellite communications, and electronic warfare systems, the platform streamlines integration and accelerates development.

High-capacity energy storage system

TDK Corporation has introduced a high-capacity energy storage system aimed at grid-scale power

management, renewable energy integration, and electrification infrastructure. Optimised charge-discharge performance enhances reliability, mini-

mises energy losses, and extends system lifespan. Scalable for utility, industrial, and microgrid applications,

the platform supports grid balancing, renewable energy stabilisation, and backup power while addressing growing demand from transportation, data centres, and industrial networks.

Multilayer metal power inductors

TAIYO YUDEN has launched a new series of multilayer metal power inductors for AI-enabled smartphones,

wearables, and TWS audio devices. Using metallic magnetic materials, they support efficient power

delivery in DC-DC converters and power systems for advanced features such as on-device AI, high-resolution audio, and enhanced sensing. Production is underway in Japan.

Highly accurate GNSS module

U-blox has introduced a new GNSS module that delivers centimetre-level

positioning accuracy worldwide without requiring extensive local RTK infrastructure. Designed for

robotics, drones, precision agriculture, surveying, and industrial automation, it supports correction data delivery through satellite and internet services for globally scalable deployment.
