

Ultrasonic flow converter

ScioSense has introduced the UFC23 ultrasonic flow converter, a new solution designed to deliver highly accurate

flow measurement while minimising power consumption in smart metering systems.

The converter combines precise time-of-flight measurement with efficient signal processing to improve low-flow detection and extend battery life. Target applications include smart water, heat, gas, and leak-detection meters, as well as intelligent utility infrastructure and energy-management systems.

High-isolation optocouplers

Vishay Intertechnology has introduced a new series of high-isolation optocouplers designed to enhance safety and reliability in electric vehicle power systems. The devices provide reinforced galvanic

isolation between high-voltage and low-voltage circuits, helping protect critical electronics from

voltage transients and electrical noise. Engineered for demanding automotive environments, the optocouplers support efficient signal transmission while improving system robustness and functional safety. Target applications include battery management systems, onboard chargers, traction inverters, and power conversion units.

Solderless connectors

Amphenol RF has introduced solderless 2.92mm PCB connectors that simplify testing and validation of high-frequency

circuit boards. The reusable connectors eliminate soldering, enabling rapid installation, removal, and design modifications while

maintaining consistent signal performance. Designed for telecommunications, aerospace, defence, and test applications, the connectors help accelerate

product development and streamline PCB validation workflows.

Connector options for board-to-board interconnects

Same Sky has expanded its interconnect portfolio with a new family of rectangular connectors for reliable board-to-board connectivity. The range

includes male and female pin headers, along

with box headers, in multiple single- and dual-row configurations. Featuring gold-flash contacts, through-hole mounting, and secure push-pull retention, the connectors provide dependable signal transmission and durability. Suitable for embedded, industrial, and consumer electronics applications, they offer a versatile and cost-effective PCB interconnect solution.

EMBEDDED

Ultra-compact GNSS-disciplined oscillator

VIAVI Solutions Inc. has launched an ultra-compact GNSS-disciplined oscillator designed to deliver precise and resilient timing for defence, aerospace, communi-

cations, and embedded systems. Built around a low-power MEMS

oscillator, it offers stability under harsh operating conditions while reducing size, weight, and power requirements. The solution supports external timing references and is positioned as a compact alternative to larger, higher-cost precision timing technologies.

Edge AI development module

Nuvoton Technology Corporation has introduced a compact edge AI development module designed to accelerate the deployment of touchless human-machine interfaces across consumer, industrial, healthcare, and security

applications. Supporting multiple built-in hand gestures, human detection, and positional tracking, the module enables

responsive, privacy-focused visual sensing without cloud con-

nectivity. Compatibility with TensorFlow Lite Micro also allows developers to deploy custom AI models, helping shorten development cycles and speed product commercialisation.

Liquid-level radar sensor

Rajguru Electronics has introduced a compact millimetre-wave radar sensor module designed for precise water-level monitoring in industrial, infrastructure, and IoT applications. Built on FMCW

radar technology, the sensor delivers highly accurate, non-contact liquid-level measurement while maintaining

low power consumption and strong resistance to interference. Suitable for smart water management, reservoir monitoring, and industrial tanks, the module supports reliable operation in challenging environments, helping improve monitoring efficiency and measurement accuracy.

Server processor for agentic AI

Nvidia has unveiled a next-generation server processor engineered specifically for agentic AI workloads, targeting faster execution of autonomous software tasks in data centres. Designed with custom

CPU cores, high-bandwidth memory and advanced multithreading capabilities, the chip accelerates AI orchestration, reasoning, code execution and data-processing

workloads. The processor also features a high-speed CPU-GPU interconnect, enabling tighter integration with accelerated computing platforms and improving system responsiveness.
