ASA motion link compliance solution

Rohde & Schwarz has launched a new ASA motion link (ASA-ML) compliance solution to help engineers validate high-speed in-vehicle data links used in advanced driver assistance and autonomous driving systems. Integrated into the company's ScopeSuite+ platform, the solution automates compliance testing and provides guided workflows for faster and more reliable signal validation. It supports the analysis of signal integrity across automotive components, including sensors, ECUs, cables, and connectors.

MOVES

Plug-in hybrid system

BYD India has introduced a new plug-in hybrid system designed to combine electric driving with extended range and reduced fuel consumption. The electric-first architecture prioritises battery-powered operation for daily use, while a petrol engine supports longer journeys by generating power and assisting when needed. Key features include intelligent energy management, multiple driving modes, and the company's Blade Battery technology focused on safety and durability.

MISCELLANEOUS

Browser-based simulation platform

ROHM Semiconductor has introduced a browser-based simulation platform that enables power electronics engineers to perform rapid loss and thermal analysis during the early stages of product development. Built on the PLECS simulation environment, the tool allows users to virtually evaluate circuit performance and device behaviour without the need for physical prototypes. Designed for industrial, automotive, and energy applications, the platform helps accelerate design verification, simplify device selection, and reduce development time through efficient virtual testing.

RF design workflow tool

Keysight Technologies has introduced a RF design workflow capability that enables engineers to capture, automate, and reuse circuit development

processes through an executable whiteboard environment. The enhancement is designed to help engineering teams preserve expertise, streamline collaboration, and accelerate RF design workflows amid growing industry talent shortages. The tool records the complete design methodology, including simulations, optimisations, parameter selections, and decision-making processes, transforming them into executable workflows.

DC-DC converter platform

Advanced Energy Industries, Inc. has launched a DC-DC converter platform for 800V data centre power architectures, targeting next-generation AI

infrastructure. The solution converts 800V DC to 50V DC, delivering high power density and advanced liquid

cooling for efficient thermal management in AI servers and

high-density computing environments. Designed for scalable, megawatt-scale AI clusters, it supports parallel operation, high-voltage insulation, and integration with broader power management systems, enabling more efficient and scalable AI data centres.

Electric lock series

Hikvision has launched a new intelligent electric lock series that combines

biometric authentication, remote access management, and smart

security integration for residential, commercial, and SME applications. The locks support multiple entry methods, including fingerprint recognition, PIN codes, RFID cards, mobile app access, one-time passwords, and mechanical keys.

Contactless payments platform for smart wearables

Infineon Technologies has launched SECORA Connect X, a platform that enables secure contactless payments

in smart wearables such as rings, fitness trackers, and smartwatches. Built around a Secure Element, it sup-

ports NFC payments, secure credential storage, card digitisation, and token management. Pre-certified components and development tools help manufacturers accelerate deployment of secure and low-power wearable payment solutions.
