

(L to R) Amitesh Kumar Sinha; Anu Garg, Chief Secretary of Odisha; Babu Mandava, Chairman and CEO, 3D Glass Solutions; Ashwini Vaishnaw, Union Minister for Electronics and IT; Mohan Charan Majhi, Chief Minister of Odisha; Dr Mukesh Mahaling, Odisha Minister for Electronics and IT; and S. Krishnan, Secretary, Ministry of Electronics and Information Technology (MeitY), at the groundbreaking ceremony for India's first advanced 3D glass substrate semiconductor packaging facility in Bhubaneswar, Odisha, on 19th April 2026

specifications, workforce training, utility planning, installation support, prototype wafer runs, and qualification processes.

• **Customer off-take.** Technology partners had to commit production and bring established customers, giving global buyers confidence in India's new manufacturing facilities.

The first company to meet all three criteria was Micron Technology. As an integrated device manufacturer (IDM), it already possessed financing, proprietary technology, and captive demand. Its entry was a turning point, signalling India's seriousness to the global semiconductor industry.

That breakthrough was followed by strong proposals from Indian companies, including Tata Electronics for wafer fabrication and packaging, and packaging proposals from CG Power and Industrial Solutions and Kaynes Technology.

Our advisory committee, comprising leading members of the Indian diaspora and global semiconductor experts, also helped refine the policy. They recommended simplifying incentives and making them uniform across silicon, display, and

compound semiconductor fabs, as well as assembly, testing, marking, and packaging (ATMP) facilities. They also advised that packaging would naturally precede fabrication, helping establish the broader ecosystem. Today, we have approved 12 semiconductor projects under this framework.

Alongside manufacturing, we recognised that semiconductor design is one of India's greatest strengths. Under the Design-Linked Incentive (DLI) scheme, 24 companies have received financial support, while more than 100 companies have been given access to world-class electronic design automation (EDA) tools following rigorous technical and commercial evaluation. Significantly, 15 of these startups have already secured institutional venture capital funding, with further investment continuing to flow into the ecosystem.

The Tata Electronics semiconductor fab at Dholera, Gujarat, represents another major milestone. Building India's first wafer fab has been a nationwide learning exercise involving Tata Electronics,

Powerchip Semiconductor Manufacturing Corporation (PSMC), the ISM, central and state governments, and construction partners such as Larsen & Toubro (L&T) and Tata Projects. Together, we have gained valuable experience in specialised infrastructure, uninterrupted power and water supply, logistics, customs, international talent, equipment movement, and regulatory requirements, while continuously refining policies to address emerging challenges.

We expect commercial production from the Tata fab to begin by 2028. Furthermore, market demand is already encouraging. Tata has secured strong customer interest across multiple technology nodes, exceeding the capacity of its initial facility. Our packaging programme has progressed even faster. Micron Technology has already started commercial production, Kaynes Technology has commenced manufacturing, and two more ATMP projects are expected to begin production later in 2026. Overall, this has been an excellent start to India's semiconductor journey.

So, all these developments in the last four-and-a-half years have given us a good base, and it has created confidence in Indian industry, as well as outside India, and as a result of that, now we are seeing a lot of traction from foreign companies from Japan, South Korea, Singapore, Malaysia, Europe, and the US. They are looking at the Indian market strategically and they clearly understand that there is a scope of development here. The semiconductor industry is going to happen here. This kind of confidence building is the greatest satisfaction, and we believe that going forward, we will attract more and more companies.

In a nutshell, the incentive amount announced by the government of India is now fully committed, and we have 12 manufacturing and 24 design projects with us.
