Power ICs and SMD transformers

RECOM has introduced a new range of power ICs and SMD transformers for engineers developing discrete isolated DC/DC power supplies. The portfolio supports flyback, push-pull, and full-

bridge topologies across low-to mid-power applications,

giving designers greater flexibility over system layout, component placement, and cost optimisation. Designed for industrial and embedded power applications, the components support multiple voltage configurations, high-temperature reflow processing, and bidirectional battery charging designs. RECOM positions the range as an alternative to fixed DC/DC modules for developers seeking customisable power architectures.

Bulkhead RF micro-coax cable connectors

Amphenol RF has expanded its MCX and MMCX connector portfolio with new bulkhead connectors for 0.81mm micro-coax cable, targeting compact

RF applications such as GPS receivers, wireless communication systems, and IoT devices. The connectors

are designed to support reliable signal transmission and flexible cable routing in high-density electronic designs. Built with nickel-plated brass bodies and gold-plated contacts, the products offer durability, corrosion resistance, and stable RF performance. Their compact cable compatibility

helps OEMs and system integrators optimise space utilisation and simplify integration in next-generation connected devices.

Clock generator chip

Diodes Incorporated has launched the PI6CG33A06, a clock generator chip for computers and data centres

using PCI Express 7.0 technology.

The chip creates timing signals that help comput-

ers transfer data and maintain system operation in AI servers, networking equipment, and computing systems. Its timing performance is below the PCIe 7.0 jitter limit, giving engineers more margin for signal handling in system designs. The chip removes the need for many external resistors, which helps reduce costs, save board space, and simplify PCB design. Each of the six outputs can be controlled separately for power management, and the chip supports Intel CK440Q-Lite standards for use in existing server designs.

AI-ready processors

Intel has introduced a new range of AI-ready processors aimed at main-

stream laptops and edge computing systems. The chips combine integrated AI acceleration, hybrid-core architecture, and power-efficient performance to bring on-device AI features such as enhanced video calls, noise

suppression, and faster multitasking to everyday PCs. Designed for students, businesses, and mobile users, the processors also target robotics, retail, and smart infrastructure applications. Engineered by Intel for cost-sensitive computing platforms, the chips focus on balancing AI capability, battery efficiency, and responsive performance for wider AI PC adoption.

Surface-mount DIP switches

Littelfuse has introduced the

Littelfuse/C&K TDB series, an ultra-miniature half-pitch surface-mount

DIP switch family designed for high-density PCB layouts in compact electronic systems. The

switches help engineers increase component density while maintaining signal reliability and manufacturing efficiency. Gold-plated bifurcated contacts improve low-resistance performance, while the sealed construction supports automated soldering and post-reflow cleaning. Compatible with standard SMT assembly processes, the series targets industrial controls, power systems, security devices, building automation, and smart home products.

8th gen medium-voltage MOSFETs

Magnachip Semiconductor has introduced eighth-generation medium-

voltage MOSFETs aimed at improving efficiency and switching performance in server

and high-performance PC power supplies. The devices support compact power architectures, faster switching,
