

on-chip cache with 16 cores and 32 threads to improve responsiveness and reduce memory-access bottlenecks in compute-intensive applications. AMD has also refined the cache stacking design to improve thermal efficiency and sustain higher operating frequencies. Compatible with the AM5 platform, the processor supports both custom PC builds and integration into prebuilt systems.

EMBEDDED

Edge computing motherboard

IBASE Technology Inc. has launched the PI800 PICO-ITX motherboard, a compact computing platform designed for

industrial and edge applications where space-efficient deployment is critical. The platform

integrates Intel Atom processors, DDR5 memory support, high-speed networking, industrial communication interfaces, and flexible expansion options for embedded and IoT systems. Developed for applications such as industrial automation, smart retail, kiosks, and digital signage, the motherboard combines low-power operation with industrial-grade reliability. Engineered for fanless edge systems, the compact platform also supports wireless connectivity and dual-display output for modern industrial environments.

New MATLAB and Simulink releases

MathWorks has released MATLAB and Simulink Release 2026a, adding

AI-powered copilots and workflow automation tools for embedded systems development. The update introduces Simulink Copilot and Polyspace

verification, and debugging while maintaining traceability and compliance. Built around a grounded AI approach, the tools generate responses using user models, workflows, and official documentation. Additional enhancements include wireless network simulation, geospatial analysis functions, interactive web visualisation tools, and improved digital filter design capabilities.

Single-board AI and IoT computers

Quectel Wireless Solutions has launched a new range of single-board computers designed for edge AI and IoT applications, combining high-performance processing with broad

connectivity and multi-OS support. The

SBC lineup targets rapid prototyping and scalable industrial deployments across applications such as robotics, smart retail, industrial automation, and digital signage. Integrated Wi-Fi, Bluetooth, Gigabit Ethernet, and optional LTE connectivity enable flexible deployment in embedded and remote environments. With Raspberry Pi-compatible form factors, rich I/O support, and multimedia capabilities, the platforms simplify integration while supporting edge computing and

AI-driven workloads.

UHF RFID reader-writer module

RapidRadio has launched the RRUH-FOEM03, a UHF RFID reader-writer OEM module built on Impinj's E-series chipset for embedded automation, tracking, and identification systems.

The module is designed to simplify RFID integration while reducing dependence on imported reader hardware for industrial and IoT applications.

Supporting the Indian UHF band and EPC Gen 2 protocol, the module offers configurable RF output power, tag reading, and antenna integration through an MMCX connector. A UART interface enables connectivity with microcontrollers and single-board computers, while onboard status indicators simplify development and deployment.

Microphone development kits

Same Sky has launched seven microphone development kits designed to simplify evaluation and testing

of MEMS and electret condenser microphone technologies. The kits help engineers compare analogue and digital microphone configurations for audio products, voice interfaces, and microphone array applications without redesigning supporting hardware. Each kit includes four detachable
