

microphone evaluation circuits with plated through-hole I/O terminals for faster integration into test environments. The portfolio covers analogue and digital MEMS microphones alongside unidirectional, omnidirectional, and noise-canceling ECM designs. Selected kits also support matched microphone array testing, enabling development of advanced audio capture and beamforming systems.

MANUFACTURING EQUIPMENT & MATERIALS

Micro-resistance welding head

KombiTec GmbH has introduced a servo-driven micro-resistance welding head designed to improve precision, repeatability, and production efficiency in electronics and precision manufacturing. The system replaces pneumatic actuation with a fully servo-controlled architecture, enabling tighter control of welding force and electrode positioning for consistent micro-weld quality. The compressed-air-free design reduces energy use, maintenance needs, and infrastructure complexity while supporting faster welding cycles for high-volume production. Developed with inverter technology from Bosch Rexroth, the platform also enables real-time process monitoring and adaptive control for smart factory environments.

TEST & MEASUREMENT

Handheld RF and microwave tester

Siglent Technologies has introduced a handheld RF and microwave testing platform that combines vector network analysis, spectrum analysis, cable and antenna testing, and time-domain analysis in a single rugged instrument. Designed for telecom,

RF validation, and field maintenance applications, the platform enables faster diagnostics and reduces the need for multiple test devices. The portable system supports wide-

frequency RF measurements, distance-to-fault analysis, impedance evaluation, and real-time spectrum monitoring for troubleshooting complex RF paths. Built for field operations, the battery-powered platform features a touchscreen interface and advanced calibration capabilities to improve measurement accuracy across lab and on-site environments. The solution targets applications including 5G infrastructure, IoT deployments, antenna validation, and microwave communication testing.

Laser radar system

Nikon Corporation has launched the APDIS MV5X laser radar system for high-speed, non-contact industrial measurement, targeting automated manufacturing environments where inspection speed and accuracy are critical. The system supports rapid scanning of complex components while reducing production interruptions and inspection bottlenecks. The compact platform is designed for both portable and inline metrology applications, including integration with robotic arms and automated guided vehicles. The technology is aimed at automotive, aerospace, and smart manufacturing sectors seeking faster, flexible quality inspection workflows.

MOVES

Low-speed electric scooter

Zelio E-Mobility has unveiled the 2026 edition of its Gracy low-speed electric

scooter, targeting urban commuters with updated styling, battery options, and rider-focused features. Designed for daily city travel, the scooter emphasises convenience, affordability, and ease of use for students and regular commuters.

The Gracy 2026 offers multiple lead-acid and lithium-ion battery configurations, supporting flexible range and charging

options. It also features a large storage compartment, keyless drive, anti-theft functions, LED lighting, and a digital instrument cluster. Built with a lightweight body and equipped with hydraulic suspension and disc braking, the scooter is aimed at improving comfort and practicality for urban mobility.

MISCELLANEOUS

PCB layout viewer

XJTAG has launched a free standalone PCB layout viewer for ODB++ data, allowing engineers to inspect and navigate board designs without using full CAD software. The lightweight tool is designed to simplify hardware debugging, validation, and board

bring-up workflows by providing direct access to PCB layout information. The viewer supports netlist-aware searches to quickly locate signals, components, and pins within complex designs. GPU-accelerated rendering enables smooth navigation across dense layouts, while the standalone architecture removes dependency on larger design toolchains. Built specifically for ODB++ data, the software helps manufacturing, diagnostics, and hardware engineers speed up issue identification and reduce reliance on design teams for layout access.
