

Cerebras targets \$3.5 billion IPO as AI chip race intensifies

AI chipmaker Cerebras Systems is pursuing a major Nasdaq listing, targeting up to \$3.5 billion by selling 28 million shares priced at \$115-\$125 each. This could value the company at \$26.6 billion. Competing with Nvidia, Cerebras offers cloud compute services fueled by an OpenAI partnership valued at over \$20 billion through 2028. This comes after the company shelved its IPO plans in 2024.

TSMC exits Arm stake with \$231 million share sale

TSMC's subsidiary completed its exit from Arm Holdings, selling its remaining 1.11 million shares for \$231 million between April 28 and 29, 2026. As disclosed in Taiwan's MOPS, the \$207.65-per-share sale impacted retained earnings by \$174 million. While altering financial portfolios amid AI stock volatility, both giants maintain their crucial manufacturing and design partnerships.

Cadence and TSMC expand pact for advanced AI silicon

Cadence expanded its partnership with TSMC to accelerate AI-driven semiconductor innovation across N3, N2, A16, and A14 process nodes. The collaboration introduces 'agent-ready' digital and analogue design flows using agentic AI to optimise chip productivity and reliability. Integrating silicon-proven IP and certified 3D-IC platforms, the alliance streamlines complex workflows for high-performance AI computing.

ISRL and AIIP partner for the US's first semiconductor subfab hub

ISRL USA and AI Infrastructure Partners (AIIP) signed an MoU to build the United States' first purpose-built semiconductor subfab R&D facility. AIIP will own the infrastructure, while ISRL USA manages technical operations. Operating as a shared Infrastructure-as-a-Service environment, the hub enables companies to conduct pre-competitive research and accelerate sustainable, high-volume chip manufacturing.

AI tools step into chip design to cut complexity

Agileo Automation has launched an AI-driven EDA solution integrating generative and agentic AI to accelerate semiconductor and PCB development workflows. The industrial-grade platform automates tasks, ensures design traceability, and supports multiple models, reducing development time in high-performance computing markets.

AI that helps design computer chips

Siemens has introduced the Fuse EDA AI Agent, an autonomous platform powered by Nvidia AI designed to orchestrate complex semiconductor, 3D IC, and PCB design workflows across engineering and manufacturing environments. The system automates multi-tool processes, features a hierarchical architecture to handle multi-step tasks and failures, and includes enterprise-grade governance with human-in-the-loop validation.

Ceramic substrate for better AI chip packaging

Kyocera has commercialised a multi-layer ceramic core substrate designed to improve stability and reduce

warpage in large 2.5D semiconductor packaging for AI and high-performance computing, mainly targeting AI processors, xPUs, and high-speed switch ASICs used in data centres. Utilising fine ceramic technology, the substrate supports finer vias, denser interconnects, and offers simulation services for thermal and mechanical optimisation.

Wafer platform adds hidden defect detection

Test Research, Inc. has introduced a modular, AI-driven wafer inspection and metrology platform designed for advanced packaging, supporting

SNIPPETS

- Siemens and TSMC expand AI-driven chip design partnership

6-inch (15.24cm) to 12-inch (30.48cm) wafers. The system combines high-resolution 3D imaging, precision measurement, and optional subsurface detection to enhance process control and production yields in chiplet and heterogeneous integration workflows.

Faster way to finish chip design

Synopsys has introduced Multiphysics Fusion, integrating Ansys engines into its EDA platform to address thermal, electromagnetic, and mechanical challenges in advanced chip/package design. The technology enables early issue detection to reduce redesigns; initial workflows target timing signoff, multi-die system design, design closure, and analogue and mixed-signal development workflows. Features include AI-driven routing, reliability analysis, and cross-domain optimisation.

Improved tools for design and analysis

Keysight Technologies has released ADS 2026, featuring enhancements across circuit simulation, electromagnetic analysis, electrothermal workflows, layout, and verification for diverse design applications. The platform boosts efficiency through Python-based automation, AI-assisted tools, and support for next-generation standards like LPDDR7, PCIe Gen7, and high-bandwidth memory.
