

electronics makers leap toward smart manufacturing by blending speed, accuracy and flexible automation for

varied production runs. Built for SME and high-mix lines,

it uses multi-head pick-and-place with dual vision and closed-loop motion to boost throughput and reduce rework. The system supports automated PCB assembly, small batch production, and integration with conveyors/ovens for more efficient shop-floor workflows.

Five-axis laser system

A five-axis laser metallisation system from Q5D is extending circuit creation beyond flat boards by directly

depositing metal traces on complex 3D surfaces with true multi-axis motion and digital CAD-to-part

workflows. Practical use cases include embedded antennas, RF shielding, sensors, and capacitive interfaces in aerospace, transportation, and advanced electronics manufacturing. Q5D

TEST & MEASUREMENT

EV charging test systems

New megawatt-class EV charging test systems are emerging to help engineers validate ultra-fast charging hardware

and protocols as electric vehicles push into heavy-

duty and industrial segments. Platforms now support up to 1500V/1500A with modular scalability and built-in compliance checks for CCS, MCS, ISO 15118, and regional standards, letting teams test both vehicles and stations in a single setup. This aids safety, interoperability, and communication testing for next-gen charging infrastructure.

Mid-range spectrum analyser

A new mid-range spectrum analyser aimed at closing a long-standing gap in high-frequency testing now brings

up to 44GHz measurement into a more accessible bench- and

production-ready form factor for RF and microwave work. With a real-time analysis option that captures transient or burst signals as short as a few microseconds, engineers can better debug, validate, and characterise satellite links, radar, navigation, and mixed-signal RF hardware without costly lab-only gear.

Embedded vision test systems

New embedded vision test systems from GÖPEL electronic combine

high-resolution capture, signal generation, and modular adaptors to

streamline quality checks for cameras, displays, and imaging devices across automotive, medical, and industrial production lines. By unifying frame grabbing, analysis, and output into a single workflow with flexible programming and boundary-scan options, they help teams validate image quality, ensure interface compatibility, and catch defects early in development and manufacturing.

MISCELLANEOUS

HVAC remote platform

Samsung's new SmartThings Pro

HVAC remote platform tackles the complexity of managing distributed cooling/heating fleets by centralising diagnostics, automation, and maintenance

workflows on a single dashboard. It provides operators with real-time fault alerts, remote troubleshooting, and integrated ticketing, reducing on-site visits and speeding responses on-site. Beyond break/fix, built-in automation and energy optimisation help standardise operations and slash consumption across multi-site commercial, residential, and hospitality portfolios.

Mini PC

Thinvent's Aero Mini PC is built for workspaces with limited desk space,

squeezing dependable performance and flexible storage into a very compact desktop design. The system balances configurable Intel processors with high-speed M.2 SSD support and accessible

front- and rear-facing I/O, addressing common heat, throttling, and connectivity issues in small form factors. It's aimed at open offices, studios, and home workstations where users need a low-profile PC without sacrificing everyday productivity.

Three-phase power monitor

A new portable three-phase power monitor lets technicians check live

electrical systems without shutdowns or cable disconnections, addressing common hurdles

in industrial plants, EV charging stations, and commercial installations. Using flexible Rogowski current probes, it measures voltage, current, active/reactive power, energy, power factor, and up to 51st-order harmonics while running, making routine maintenance, energy audits, and distortion analysis safer and faster on live setups.
