

Practical Thinking: Washing Machine SMPS Section – Equipped with Diotec Bridge Rectifier GBU10M

Modern washing machines efficient and robust power supply systems to ensure reliable performance. The **SMPS (Switched Mode Power Supply)** section plays a critical role in converting AC mains input into stable DC voltage required for microcontrollers, motor drivers, display panels, sensors, and communication interfaces. In the input stage of the SMPS, AC voltage must first be converted into DC. This is where a high-reliability bridge rectifier becomes essential.

The **GBU10M** bridge rectifier from Diotec Semiconductor is a robust and efficient solution widely used in home appliance power applications.

Why GBU10M?

The **GBU10M** is a single-phase glass-passivated bridge rectifier designed for high current capability and long-term reliability.

Key Features:

- Average forward rectified current: 10A
- Reverse voltage (VRRM): up to 1000V
- Low forward voltage drop for improved efficiency
- High surge current capability

Why It Fits Washing Machine SMPS Applications

- Handles high inrush current during startup
- Suitable for universal AC input (110V–300V)
- Ensures stable DC bus for downstream PWM controllers
- Compact GBU package saves PCB space
- High reliability under continuous operation

In washing machines, where vibration, humidity, and thermal stress are common, selecting a reliable bridge rectifier is critical for long service life and reduced failure rates.

Reliable power starts at the input stage — and choosing the right rectifier makes all the difference.
