1 REDEFINING HOW MODERN BUILDINGS THINK AND PERFORM

A Mumbai-based startup delivering wireless, cloud-powered building intelligence to optimise energy use, automation, security, and performance at scale.

Founded in 2017 by Gaurav Bali and Garima Bharadwaj, Enlite Research Private Limited, based in Mumbai, is developing comprehensive, next-generation building management systems that monitor, automate, and improve building systems in real time. These systems include energy usage, lighting, HVAC, and asset management, making buildings more efficient and easier to manage.

“By replacing traditional hardwired, binary building controls with flexible, data-driven platforms, we help building owners improve energy efficiency, sustainability, and operational performance. Our solutions provide actionable insights through digital dashboards, allowing smarter decision-making, lower operating costs, and better occupant comfort across modern built environments,” shares Garima.

The startup claims to provide a comprehensive solution for smart buildings across three interconnected technology layers. At the centre is the Intelligence layer, powered by its Know Your Building (KYB) platform. This cloud-based system continuously monitors buildings, analyses data, and helps owners and operators make better decisions in real time, whether for a single building or a large portfolio. The Access and Identity layer, called Enlite Enable, manages

secure, smooth access across facilities using digital credentials, improving security and operational efficiency. At the base is the Control and Connectivity layer, powered by Enlite’s wireless STR hardware, which connects all devices reliably without traditional wiring, allowing everything to work together as one smart system.

Garima highlights the company’s global patent secured in 2025, which protects key innovations in wireless building management technology.

The patent covers communication methods, system design, and intelligent control for complex building environments. “Additionally, we have filed three more patent applications and have three others under review, focusing on areas like scalability, security, and distributed intelligence. Together, these patents protect Enlite’s core technologies, support reliable cloud-based automation, and strengthen the company’s long-term competitive edge,” she adds.

Enlite primarily serves large and complex environments where automation requirements are high and conventional systems struggle to scale effectively. Its customers span greenfield, brownfield, and fit-out projects, including global capability centres, hospitals, hospitality properties, office campuses, and mixed use developments.

The startup follows a hybrid model that combines in-house design excellence with outsourced production. All core product design activities, including system architecture, hardware layout, component selection, firmware development, and schematic design, are executed internally. Critical components are primarily sourced within India to ensure supply stability and scalability, while select specialised components are procured from the
