

New milestone in D-band wireless technology

Breakthrough in D-band Wireless: Anritsu and VTT demonstrate world-leading transmitarray-based high-speed connectivity

Anritsu Corporation and VTT Technical Research Centre of Finland have achieved a significant advancement in D-band wireless communications by validating a transmitarray beam-steering system that enables multi-gigabit, high-capacity links across 110-170GHz for next-generation networks. The jointly demonstrated system, engineered by collaborators in Finland and tested with Anritsu's precision equipment, delivered stable tens-of-Gbps data rates, including 20Gbps over 1m and reliable links up to 7m under realistic over-the-air conditions, setting a new benchmark for D-band connectivity. The milestone could accelerate future 6G industrial, defense, and backhaul deployments.

Quantum-inspired tech speeds automotive design

An advancement in automotive design by applying quantum-inspired technology and AI to dramatically speed up connector pin layout for electric control units, is likely to cut design time over 20x compared with traditional methods. This has been announced by Toyota Systems and Fujitsu. The system, engineered by a team in Japan using Fujitsu's Digital Annealer and AI models trained on expert design data, automates complex optimisation tasks previously done by hand. Developed at Toyota Systems with Toyota Motor Corporation's standards and expertise, the innovation aims to boost efficiency, reduce costs, and support broader digitalisation across Toyota's manufacturing ecosystem.
