

CMOS operational amplifiers

ROHM Semiconductor has introduced a new portfolio of 17 high-precision CMOS operational amplifiers ‘TLRx728’

and ‘BD728x,’ designed to enhance accuracy, speed, and

flexibility in analogue signal processing across automotive, industrial, and consumer systems. The company claims that the lineup balances noise, speed, and precision.

Flyback IC family

The TOPSwitchGaN flyback IC family from Power Integrations pushes switching power supplies into high-wattage

applications, enabling more compact and efficient industrial and consumer

systems. The solution improves energy transfer control, reduces switching losses, and enhances thermal stability under heavy loads. The design extends traditional flyback converter limits, typically used in low-to-mid power ranges, toward higher output capabilities.

Dual-cache desktop CPU

A dual-cache desktop CPU leveraging advanced 3D stacking technology has been introduced by AMD to significantly

boost latency, throughput, and performance in gaming and creative workloads. The processor

doubles cache availability by stacking memory across multiple compute dies, reducing data access time and improving responsiveness.

MEMS Pirani vacuum transducer

Posifa Technologies has launched the PVC4001-C, a MEMS Pirani vacuum transducer for portable gauges, integrating sensing, processing, and pressure

measurement. Combining a MEMS thermal conduction sensor, microprocessor, and barometric sensor, it measures 0.001-900 Torr with a sub-200ms response.

MRAM-based memory chip

UNISYST, a new MRAM-based memory chip, delivers read speeds up to 400MB/s and write speeds

around 90MB/s, over 400x faster than NOR flash. Offering 10x higher endurance and

in-place code execution, it supports frequent reconfiguration with predictable performance. Developed for bandwidth-critical embedded systems, it advances durable, fast memory for IoT and industrial applications.

GaN and SiC power systems

A space-grade choke for GaN and SiC power systems enhances reliability and suppresses high-frequency

noise in aerospace and defence electronics. The rugged surface-mount design ensures stable opera-

tion in extreme environments, improving EMI control while remaining compact. Developed for high-performance applications, it reflects growing GaN/SiC adoption where efficiency, resilience, and durability are vital for mission-critical systems.

EMBEDDED

GaN-powered BLDC motor drive evaluation board

Efficient Power Conversion (EPC) has launched the EPC91121, a GaN-powered BLDC motor drive evaluation board featuring a fully integrated 3-phase inverter. Using the Gen-7

EPC2366 eGaN FET, it delivers 70A peak current, supports 18-30V input, and enables PWM switching to 150kHz with sensing, protection, and gate driving, advancing compact, efficient GaN motor control adoption.

Wireless 4-channel IoT relay board

A wireless ADIY four-channel IoT relay board designed for automation enables remote control of multiple electrical

devices, improving flexibility in smart systems. The module integrates four independent relays that

can switch high-voltage loads using low-power signals, supporting applications in home and industrial automation. It features wireless connectivity, compact design, and compatibility with microcontrollers for integration.

Computer on modules

congatec has introduced rugged computer on modules (COMs) designed

to deliver edge AI performance across extreme temperatures from -40°C to

+85°C, enabling reliable deployment in harsh industrial environments. The platforms support applications such as robotics, smart infrastructure, and autonomous systems.

Compact AI computing system

ASRock Industrial has introduced a compact AI computing system designed to run demanding workloads locally,

delivering up to 180 TOPS of AI inferencing in space-constrained environments. The NUC(S) Ultra 300 BOX series integrates Intel
