

Core Ultra processors with advanced Xe3 graphics and NPU acceleration, enabling real-time AI processing, multitasking, and support for up to four 8K displays.

ASRock Industrial

Power modules

New power modules, QSiC Dual3, targeting data centres and industrial drives, have been introduced to improve efficiency, thermal perfor-

mance, and power density in high-demand applications. The modules

enable smaller converter designs, reduced heat generation, and a transition away from traditional IGBT-based architectures. Built using advanced semiconductor technologies, they support high-frequency switching and optimised energy conversion.

SemiQ

Edge AI platforms

ADLINK Technology has launched edge AI platforms built on Nvidia

IGX Thor and Jetson Thor to enable high-performance AI

processing directly in industrial and robotic systems. The platforms deliver higher compute capability, enhanced connectivity, and integrated safety features, supporting applications such as humanoid robots, medical imaging, and autonomous machines. The systems improve real-time decision-making by running large AI models locally.

ADLINK Technology

mSiC power modules

Microchip Technology has introduced BZPACK mSiC power modules built to work reliably in tough conditions

like high heat, humidity, and voltage, while making system

design and assembly easier. The modules are tested for long durations and come in different types such as half bridge, full bridge, and three phase, so designers can choose what fits their system. They use materials that help with insulation and heat control, and maintain stable performance across temperature.

DC-DC power delivery board

Navitas Semiconductor has unveiled a DC-DC power delivery board that converts 800V directly to 6V in a single

stage, eliminating intermediate conversion

and reshaping data centre power architecture. The board removes the traditional 48V bus, reducing power losses, lowering system cost, and simplifying server design while achieving up to 96.5% efficiency and high power density.

Navitas Semiconductor

AC-DC power supply

Advanced Energy has introduced a compact 600W AC-DC power supply designed as a drop-in upgrade for

existing systems, enabling higher output without redesigning

hardware. The AIF13WAC module delivers up to 94% efficiency and 20% more power than its predecessor while retaining the same full-brick form factor, ensuring compatibility with existing accessories.

MANUFACTURING EQUIPMENT & MATERIALS

Ultrasonic welding system

This ultrasonic welding system expands high-power assembly capabilities, enabling stronger and more precise joining in electronics manufac-

turing. The technology improves energy transfer efficiency,

reduces cycle time, and enhances reliability for complex component assembly under industrial conditions. This advancement supports compact, high-speed production of electronic devices, improving scalability for consumer electronics, automotive modules, and power systems while maintaining clean, adhesive-free bonding and production efficiency.

Kulicke & Soffa

TEST & MEASUREMENT

Precision 3D inspection system

This precision 3D inspection system

redefines quality standards for through-hole technology (THT) soldering by enabling accurate, real-time measurement of complex solder joints and components. The solution improves defect detection while
