AI-ready PCB test platform

An AI-ready PCB test platform has been introduced to streamline validation and debugging by

combining automated analysis with real-time insights into board performance. The system enables engineers to test, monitor, and optimise PCB designs more efficiently, reducing manual intervention and accelerating development cycles.

New anniversary edition electric SUV

BYD India has introduced a special anniversary edition of its Sealion 7 electric SUV, targeting the premium

EV segment with enhanced ownership benefits and extended battery

warranty. The limited-edition model strengthens value through added customer incentives while retaining the SUV's core performance and design features. It is positioned to attract buyers seeking long-term reliability and premium electric mobility solutions.

MISCELLANEOUS

5MP RGB-IR camera

e-con Systems has launched the STURDeCAM57, a 5MP global shutter RGB-IR camera designed for in-cabin

monitoring, combining visible and infrared imaging in a single device to enable reliable AI

vision across lighting conditions. The

camera streams RGB and IR data simultaneously, features an onboard image signal processor for real-time processing, and integrates 940nm IR illumination for low- and no-light operation.

9V microLED platform

Aledia has introduced a 9V microLED platform aimed at simplifying manufacturing and accelerating large-scale

adoption of next-generation displays. The FlexiNOVA microLED enables single-stage higher-voltage operation, reducing system complexity and improving power efficiency for display architectures.

Software platform

A software platform from Keysight Technologies targets real-world AI bottlenecks by enabling end-to-end

validation, explainability, and monitoring of AI systems in safety-critical

applications. The platform integrates dataset analysis, model explainability, real-world inference testing, and continuous monitoring into a unified workflow, addressing gaps between development and deployment.

Open source AI models

Nvidia has introduced open source AI models designed to accelerate quantum processor development by

automating calibration and error correction, two major bottlenecks in quantum computing. The Ising model family delivers up to 2.5x faster processing and three times higher accuracy in error decoding, improving system reliability.

Secure PCB data exploration tool

A secure PCB data exploration tool has been introduced to help engineers analyse, visualise, and protect sensi-

tive design data within a unified environment.

The platform enables safe handling of PCB files while offering detailed inspection, traceability, and collaboration features for design teams. It also supports secure sharing and controlled access, reducing exposure of intellectual property during design workflows.

Hybrid development board

Rajguru Electronics has introduced a hybrid development board that combines single-board computer performance with microcontroller precision

to streamline edge AI and embedded system design. Powered by a Qualcomm Dragonwing QRB2210

processor and STM32U585 microcontroller, it enables simultaneous high-level OS operation and real-time control. The platform supports up to 4GB RAM, 32GB eMMC, Debian Linux, and Python-based development. Engineered by a team in India, it simplifies prototyping for robotics, IoT, and machine vision. The launch reflects rising demand for unified platforms that bridge AI processing and deterministic embedded control.

Errata

We regret the error in the April issue of *Electronics For You* (New Products, Embedded section), where a Rajguru Electronics hybrid development board was incorrectly described as AMD-based; it uses a Qualcomm Dragonwing processor instead. The correct full description appears in the box above.
