

## Kaynes' ₹3.3 billion semiconductor plant inaugurated in Gujarat

Kaynes Technology India has inaugurated a ₹3.3 billion OSAT facility in Sanand, Gujarat, to produce intelligent power modules for EVs, industry, and exports. Prime Minister Modi, at the ceremony, hailed it as a milestone in India's semiconductor ecosystem, following Micron's recent launch. With overseas orders secured, the plant supports India's 'Techade' ambitions, backed by mineral recycling and Rare Earth Corridor initiatives. (Photo Credit: <https://www.pib.gov.in>)

### Chip design solution

Synopsys has introduced multiphysics fusion technology, integrating Ansys multiphysics engines into its EDA tools to address electromagnet-

ics, thermal, and mechanical effects that impact chip performance and reliability. The approach embeds multiphysics analysis into the design flow, helping teams detect voltage drop, thermal issues, and electro-magnetic coupling earlier, reduce

rework, and improve power, performance, and area. The first rollout covers timing signoff, multi-die design, design closure, and analogue and mixed-signal design, combining thermal, power integrity, and routing analysis across stages. The solutions are currently in beta with early users and are expected to move into production use soon.

### Improved tools for design and analysis

Keysight Technologies has released ADS 2026 with updates across circuit, EM, electrothermal, layout, and verification, supporting RF, microwave, high-speed digital, power, quantum, and photonics design in one flow. The release improves simulation accuracy, runtime,

and automation using Python and HPC, while streamlining schematic-to-layout workflows. Circuit simulation adds BSIMIMG 103.1.0 and better DC convergence for SOI, while EM tools gain

a new FEM solver and faster momentum runs. It also expands high-speed digital support to LPDDR6, LPDDR7, HBM3, PCIe Gen7, and USB, along with improved import, verification, and AI-based help features.
