

Chip design AI system

Tattvam AI is being developed to reduce chip design complexity and shorten development cycles. Chip design today involves large teams, long timelines, and repeated manual work, with late-stage changes often causing delays across the system. The process requires managing trade-offs across power, performance, and area, which existing tools cannot fully handle. Tattvam AI brings a unified approach, helping architects, designers, and verification teams explore design options, automate routine decisions, and maintain consistency across stages. It can adapt to design changes without cascading impact, allowing engineers to evaluate multiple paths and reduce iterations while keeping control over key decisions.

Tata Semiconductor raises \$735 million for Dholera fab

Tata Semiconductor Manufacturing Pvt Ltd (TSML) has secured ₹168.35 billion (\$735 million) in loans

Infineon and Zenerize join hands to bring SiC tech to India's energy sector

Infineon Technologies has partnered with India's Zenerize to advance renewable energy and electric mobility. Announced at the Bharat Electricity Summit 2026, the collaboration will deliver SiC semiconductors and engineering support to enhance solar inverters, EV chargers, and storage systems. Not a joint venture, the partnership strengthens India's energy-transition ambitions, self-reliance, and global competitiveness in power electronics.

Cyient buys majority stake in US-based Kinetic for \$93 million

Cyient Ltd is acquiring Kinetic Technologies for \$93 million (₹8.4 billion), securing over 65% via Cyient Semiconductors. Closing by April 2026, this strengthens its position in the \$40 billion power semiconductor market across data centres, automotive, electrification, industrial automation, networking, and edge AI. Kinetic's expertise, patents, and \$41 million revenue will accelerate custom chip

development, enhance power management ICs, and improve performance, scalability, and cost efficiency, with its leadership and engineering teams retained.

US unveils \$250 million Pax Silica Fund to lock down semiconductor supply chains

The US State Department will establish

a \$250 million Pax Silica Fund to strengthen global semiconductor supply chains. Structured via foreign assistance and private co-investment, it targets critical minerals, processing, and infrastructure. Partner nations, including India, Japan, and the UK, will collaborate to

- Samsung bets \$73 billion on chips and future tech growth
- Nvidia invests \$2 billion in Marvell to expand AI infrastructure
- GlobalFoundries files patent lawsuits against Tower Semiconductor
- Broadcom appoints Amie Thuener as new chief financial officer

build diversified, resilient chip ecosystems amid geopolitical tensions.

Nvidia secures China approval for H200 AI chip shipments

Nvidia has reportedly secured Beijing's approval to sell H200 AI chips in China, reviving shipments that were paused amid US-China tensions. The firm is also modifying designs to meet local rules. ByteDance, Tencent, Alibaba, and DeepSeek are among customers granted preliminary import clearance, though final regulatory conditions remain pending.

Apple commits \$400 million to boost US chipmaking

Apple has expanded its 'American Manufacturing Program,' investing \$400 million through 2030 with Bosch, Cirrus Logic, TDK, and Qnity Electronics. The initiative boosts US semiconductor production by supporting sensors, circuits, and materials, reinforcing Apple's \$600 billion domestic manufacturing strategy amid geopolitical uncertainty and supply chain risks.

Japan approves an additional \$3.96 billion for chipmaker Rapidus

Japan's industry ministry has nodded to an additional ¥631.5 billion (\$3.96 billion) for Rapidus, raising total R&D support to ¥2.354 trillion. The funding accelerates 2-nanometre chip development, with mass production planned for 2027, while the government backs semiconductor design projects by Fujitsu and IBM Japan.
