opportunities from reputed organisations such as the National Informatics Centre and Instrumentation Limited, but consciously decided not to pursue them, as the comfort and stability they offered did not align with his ambitions.

Unwilling to take the easier route, he chose instead to work with smaller companies, where salaries were modest but learning opportunities were substantial. Working under a strict boss, Ganesh embraced challenges early on and faced a steep learning curve. He firmly believed that facing hardships and stretching his limits would help him grow far more than settling into a comfortable, predictable career path.

While his first boss had been extremely strict and difficult, his second workplace offered a stark contrast. “It was a very small company, with just two founders and one employee, and I was the fourth member, but the people were exceptionally supportive and inspiring,” shares Ganesh.

Despite the positive environment, he stayed there for only about 18 months. He felt a constant urge to do something on his own and test his capabilities. Around this time, he had recently got married and had taken a small loan of ₹11,000 from his employer to buy a scooter.

“When I decided to resign, a portion of the loan was still unpaid. To honour my commitment, I proposed taking up design projects for the company instead of drawing a salary, and used the earnings to repay the remaining amount,” shares Ganesh.

A turning point came when his former employer invited him to return with a better offer. Instead of accepting employment, Ganesh expressed his desire to start his own venture. Encouraging this ambition, his mentor suggested he begin as a consultant and even supported him financially by acting as a guarantor for a ₹55,000 loan from the State Bank of India. With this modest funding, Ganesh purchased a computer and founded his first

company, Node Micro Systems, where he provided design services, including embedded software and hardware development.

The early days were marked by severe resource constraints. He worked without basic equipment, such as multimeters or oscilloscopes, and even lacked a proper workspace. Improvising with what was available, he would sit on the floor, using a household grain container as a makeshift workbench to assemble and test circuit boards.

For nearly two years, he worked independently, building expertise and confidence. During this time, he took on a project to design a PBX (private branch exchange) system. Around the same period, his close friend and classmate, Dharendra Savla, joined him in Vadodara and began contributing to the work. Both shared a common vision: to move beyond services and build their own products.

Recognising their ambition, Ganesh’s former boss proposed forming a partnership company. This led to the creation of Matrix Systems, with Ganesh, his friend’s wife, and his boss’s wife as partners. The company’s first product was the PBX system that Ganesh had been developing. “Initially, I managed both ventures, Node Micro Systems for consultancy and Matrix Systems for product development. Over time, my focus shifted entirely to building and manufacturing products, with PBX systems becoming the cornerstone of my business,” shares Ganesh.
