AI embedded processors

AMD has introduced the Ryzen AI Embedded X100 series processors, combining CPU, GPU, and NPU acceleration on a single SoC for real-time

AI in embedded systems. With a unified memory architecture and up to 16 Zen 5 CPU cores, the processors support low-

latency perception, decision-making, and control workloads. They support Linux, ROCm, PyTorch, ONNX, and TensorFlow, enabling flexible AI development. Designed for continuous operation across demanding environments, the series targets humanoid robots, industrial automation, surgical systems, autonomous machines, aerospace, defence, and medical equipment where on-device AI and real-time response are critical.

Automotive diodes

Littelfuse has launched the FlatSuppressX TP5.0SMD-FL and TP1KSMB-FL automotive TVS diode series to protect

sensitive 48V vehicle electronics from transient overvoltage events. The devices use proprietary FlatSuppressX technology with a foldback/snapback

characteristic that maintains a lower, more stable clamping voltage during high-energy surges. Designed for DC/DC converters, gate drivers, power management ICs, battery disconnect units, and zone control systems, the diodes support ISO 21780-compliant 48V architectures. Their fast transient response and compact surface-mount packages enable reliable protection while allowing lower-voltage

downstream components, potentially reducing bill of materials costs, and improving design flexibility.

Chip-scale atomic clock

Microchip Technology has introduced the Space CSAC-SA65, a chip-scale atomic clock designed to deliver precise, resilient timing for satellite

systems operating in demanding environments.

Built for LEO missions, it supports satellite-to-cellular communications, alternative navigation, Earth imaging, assured positioning, navigation and timing, and satellite cross-linking. Its radiation-tolerant design, compact footprint, low power consumption, and extended-temperature operation suit CubeSats and other power-constrained platforms. A 1PPS interface enables system synchronisation, while atomic stability reduces dependence on external GNSS references. The COTS device builds on Microchip's Space CSAC-SA45 and supports Clockstudio software.

Disc ceramic capacitors

Murata Manufacturing has introduced the DE5 series of automotive

safety-certified disc ceramic capacitors for high-voltage AC power applications. Certified to

IEC 60384-14 X1/Y1, the series offers higher voltage and impulse resistance capability than conventional Y2-class devices, supporting safer designs in EV on-board chargers and industrial power systems. Rated for up to 1500V DC, the capacitors provide EMI filtering and electrical isolation

in high-voltage circuits. AEC-Q200 Rev. E qualification supports automotive use, while through-hole construction enables straightforward PCB integration. Applications include EV charging infrastructure, renewable energy equipment, and AC input filters.

Automotive-grade chip resistors

Stackpole Electronics has expanded its RMCA series of automotive-grade chip resistors with new high-power and

ultra-high-power variants designed to handle greater power without increasing PCB

footprint. The thick-film resistors provide higher power density, helping engineers conserve board space while improving thermal management in compact electronics. AEC-Q200 qualification and sulphur-resistant inner terminations support reliability in demanding environments. The series targets automotive, industrial, transportation, and power-management applications, including current sensing, voltage division, and biasing. Its automotive-grade construction also supports long-term performance and compliance with industry requirements.

Aluminium electrolytic capacitors

TDK Corporation has expanded its aluminium electrolytic capacitor portfolio

with 125V versions of the B43693/B43793 series and upgraded 63V B41687/B41787

series, targeting compact DC-link designs in battery-powered systems. The higher-voltage capacitors can support increased DC-link voltage with a single component, reducing component count and simplifying capacitor-bank
