

layouts. Low ESR and high ripple-current capability help limit power losses and thermal stress. Designed for small EVs, micromobility platforms, forklifts, electric boats, humanoid robots, and industrial equipment, the capacitors also offer high-temperature and vibration resistance for demanding power electronics.

Infrared receiver modules

Vishay Intertechnology has introduced the TSOP15300 series of infrared

receiver modules, supporting a broad range of modulation frequencies to handle multiple remote-control protocols with a single component. Unlike

conventional receivers designed around one frequency, the series combines a photodetector, preamplifier, and IR filter to reduce component count and PCB space. Designed for TVs, audio systems, gaming consoles, soundbars, projectors, and set-top boxes, the receivers offer strong interference rejection against common electronic sources. Their low-power operation and direct microprocessor interface simplify remote-control designs while supporting reliable long-range communication.

Compact power board

ROHM has introduced the BD83070GWL-EVK-002 evaluation board, featuring the BD83070GWL

buck-boost DC-DC converter for compact, battery-powered electronics. The reference

platform demonstrates high-efficiency power conversion with low standby consumption and a small implementation footprint using few external components. It also provides circuit layouts and a bill of materials to simplify production development.

Designed for wearables, biometric sensors, AR/VR devices, BLE equipment, smart locks, and other IoT products, the board helps engineers evaluate power-management performance, conserve PCB space, extend battery operation, and accelerate the transition from prototype to production.

Power factor correction module

Advanced Energy has introduced the AIH03ZPFC, a board-mounted power factor correction module that delivers

1100W in a compact half-brick package. Designed for space-constrained power

systems, it combines high efficiency with digital PMBus control, inrush current limiting, and an auxiliary power output. The module provides a regulated 390V DC output from universal AC input, while its high power density helps reduce system size and thermal losses. Target applications include industrial automation, medical equipment, defence electronics, and telecommunications, where compact, efficient AC-DC front-end conversion and simplified power architecture are essential.

DDR5 MRDIMM chipset

Renesas Electronics has introduced its third-generation DDR5 MRDIMM chipset, designed to increase memory

bandwidth for AI, cloud computing, and data-intensive server workloads. The chipset

combines the RRG5013 multiplexed registering clock driver and RRG5103 multiplexed data buffer, supporting memory speeds up to 16,000MT/s. It delivers higher bandwidth while maintaining compatibility with existing DDR5 server infrastructure, allowing manufacturers to upgrade performance without redesigning memory architectures. Features such as device

equalisation self-train mode help improve signal integrity and reliability. The platform also includes power-management and monitoring components for scalable, efficient server memory systems.

EMBEDDED

Stereo smart amplifier

Nuvoton Technology has launched the NAU83G60YG stereo smart amplifier, combining nonlinear adaptive speaker

control with DSP to reduce distortion and improve voice clarity in AI-enabled audio

systems. Its Klippel Controlled Sound technology dynamically compensates for speaker behaviour while protecting against thermal and mechanical overload. Integrated sensing and low-latency processing support acoustic echo cancellation, active noise cancellation, and clearer voice interactions. Designed for conference speakerphones, smart speakers, professional monitors, and automotive smart cockpits, the amplifier also enhances bass response and output consistency, helping improve communication quality and wake-word recognition in connected devices.

Power modules

WeEn Semiconductors has introduced the WMSC family of SiC AC-DC and DC-DC power modules, covering voltage ratings from 1200V to 2300V

for high-voltage power conversion. The portfolio supports solid-state

transformers, EV fast chargers, smart grids, renewable energy systems, and AI data-centre power infrastructure. Available in 2-level and 3-level topologies, the modules combine low-inductance construction with high switching
