Wireless module for smart home and IoT devices

Quectel Wireless Solutions has launched the FCM665D, a Wi-Fi 6 and Bluetooth module with integrated

edge AI processing for smart home, smart building, and industrial IoT devices. Its multicore Arm-based processor supports local voice recognition, image processing, and multimedia workloads, reducing reliance on cloud services and improving response times. The module combines wireless connectivity, memory, image acceleration, Ethernet support, and security features in a compact platform. Applications include video doorbells, smart locks, intelligent lighting, energy systems, and building controls, enabling faster, lower-latency AI functionality at the device level.

DC/DC power module

Rajguru Electronics has introduced the HLK-150MQ110S24A 150W DC/DC power module from Shenzhen Hi-Link Electronic, designed for railway and transportation electronics requiring regulated, isolated power. Its wide 43V DC-160V DC input range

accommodates varying railway power buses while delivering a stable 24V

output. The quarter-brick module integrates overcurrent, overvoltage, over-temperature, undervoltage, and short-circuit protection, along with high-voltage isolation. Designed to meet EN50155 requirements, it operates across demanding temperature conditions. Applications include railway control electronics, onboard equipment, and other transportation systems requiring compact, reliable power conversion.

COM-HPC client module

Congatec has introduced the conga-HPC/cRX1, a COM-HPC client module based on AMD Ryzen AI Embedded

X100 series processors, combining CPU, GPU, and NPU resources for embedded AI workloads. The platform enables local AI inference, real-time control, and graphics processing without requiring discrete accelerators. Designed for robotics, autonomous vehicles, medical devices, and industrial automation, it supports multiple displays, high-speed networking, PCIe expansion, and onboard storage. Its unified memory architecture enables efficient data sharing across processing resources, while industrial-grade variants support harsh environments, making it suitable for demanding physical AI applications.

MANUFACTURING EQUIPMENT & MATERIALS

SMT pick-and-place platforms

Fuji Corporation has expanded its NXTR and AIMEXR SMT pick-and-place platforms to handle oversized, heavy components for AI servers

and advanced computing systems. The machines can place components measuring up to 200mm × 200mm and weighing up to 2kg using standard configurations, eliminating the need for dedicated hardware modifications. The capability targets large GPU, ASIC, HBM, and co-packaged optics modules used in generative AI infrastructure. Developed under Fuji's Zero Placement Limits concept, the enhancement helps electronics manufacturers accommodate evolving semiconductor package sizes while maintaining automated assembly for AI servers, networking equipment, and data-centre hardware.

Wave soldering pot

American Hakko Products has introduced the HAKKO FX-310 wave soldering pot, a next-generation system designed to improve soldering consistency, flexibility, and process control.

Its redesigned two-piece architecture provides more workspace for larger PCBs, while interchangeable NP01 Series nozzles support specialised soldering applications. Programmable controls allow users to store process presets for repeatable production, while
