

nitrogen input and an enclosed solder pot help reduce oxidation and improve joint quality. Ethernet connectivity and HAKKO control software enable remote monitoring. The system targets electronics manufacturing, prototyping, research, repair, and production environments requiring reliable soldering processes.

TEST & MEASUREMENT

Software for three-phase power analysis on oscilloscopes

Rohde & Schwarz has introduced the R&S MXO-K333 software option for three-phase power analysis on its

MXO series oscilloscopes, helping engineers diagnose

power-system issues without switching instruments. The software keeps voltage and current waveforms visible alongside calculated power values, enabling correlation with switching events, transients and control signals. A guided setup supports common three-phase configurations and automatically calculates active, reactive and total power, power factor, and efficiency. Phasor diagrams, harmonic analysis, and THD measurements support compliance testing. The solution targets development and troubleshooting of AC systems, motor drives, and inverters.

Modular battery cell tester

GÖPEL electronic has introduced a modular battery cell tester designed to assess battery quality and performance during development and production. The system tests multiple

cells simultaneously and performs open circuit voltage and alternating current

internal resistance measurements to identify defective, ageing, or mismatched cells. Its modular architecture supports different testing requirements and integration with automated production equipment for rapid batch inspection. The tester is suited to incoming inspection, production-line quality checks, and cell grouping before module or pack assembly. It targets automotive battery manufacturers, EV makers, cell suppliers, and testing laboratories.

Radar-based smart eBike

n+ has unveiled the Volkswagen Smart eBike, bringing radar-based traffic detection and connected safety

technology to electric bicycles. Developed under licence from Volkswa-

gen, the eBike features Smart View, combining rear radar, a camera, and handlebar display to detect approaching traffic and provide visual alerts. Radar-triggered lighting improves rider visibility, while connected Smart Glasses display blind-spot warnings, navigation, and ride information. The smart helmet adds integrated lighting, crash detection, and MIPS protection. The technologies are designed for urban commuting and higher-traffic riding, helping cyclists improve rear awareness, visibility, and overall safety.

MISCELLANEOUS

Design and verification solution

Keysight Technologies has introduced Keysight Multiphysics, a design and verification solution that helps engineers identify structural weaknesses before physical prototyping. Its initial release simulates drop, shock, and vibration conditions, allowing teams

to detect potential failures earlier in the product development cycle. Pre-built application templates simplify

simulation setup and enable engineers to perform analysis without

dedicated CAE expertise. By bringing multiphysics analysis into the electronics design workflow, the tool can reduce dependence on repeated physical prototypes and external testing. It is aimed at electronics development teams designing compact products where mechanical and electrical interactions can affect reliability.

AI-powered tools and integrated simulation

Siemens has updated its Simcenter software portfolio with AI-powered tools and integrated simulation capabilities to help engineers evaluate designs faster and detect problems

earlier. Simcenter PhysicsAI uses simulation data to create predictive models that can rapidly assess new designs, while PhysicsAI Generate produces alternative concepts based on engineering requirements and existing data. Integration between Simcenter Simsolid and Designcenter enables structural analysis directly on CAD geometry, simplifying simulation preparation. Expanded multiphysics connections support electromagnetic, thermal, fluid, and system-level analysis. The update targets electronics, automotive, energy, and industrial engineering applications requiring faster design validation and development.
