

India set to add several semiconductor facilities

India is expected to add five to eight semiconductor facilities over the next seven to eight years, Prime Minister Narendra Modi disclosed recently. Micron, Kaynes Semicon, and CG Semi have begun commercial production and exports already. Nine more projects have been approved under ISM's first phase, while the second phase has received ₹1.27 trillion. Modi also announced AI training for 10 million youth. Here is some related news from India and beyond.

Karnataka eyes Japan and Luxembourg for semicon investments

Karnataka is pursuing investment and technology partnerships with Luxembourg and Japan to strengthen its industrial and semiconductor ecosystem. The state plans an investment outreach programme in Fukuoka, Japan, focused on attracting semiconductor companies, while discussions with Luxembourg covered opportunities in technology, innovation, advanced manufacturing, clean energy, and automotive sectors.

Tata Electronics to start India's first mature-node wafer production

Tata Electronics plans to begin large-scale semiconductor wafer production at its Dholera, Gujarat fab using mature 90nm and 55nm technologies, before advancing to 28nm. Partnering with Taiwan's PSMC, Tata will gradually scale capabilities. The government

expects commercial operations by mid-2028, marking a phased approach to building India's domestic chip manufacturing ecosystem.

India expands semiconductor and AI capabilities

India is expanding its semiconductor and AI ecosystem through 12 approved semiconductor projects worth over ₹1.64 trillion, with three facilities already in commercial production. Semicon India 2.0 has received ₹1.275 trillion to support chip design, fabs, packaging, equipment, and talent. Meanwhile, 45,000+ GPUs and indigenous AI models are strengthening India's computing capabilities.

India's ISM 2.0 expands semiconductor ecosystem support

India's ₹1.27 trillion ISM 2.0 cuts silicon fab subsidies to 40% but expands incentives for semiconductor

equipment, chemicals, gases, and materials. The programme aims to reduce import dependence and build a broader domestic supply chain, while supporting fabs, advanced packaging, and conventional packaging as India moves towards large-scale chip manufacturing.

AI tool helps design PCBs faster

Cadence has introduced AuraStack AI Super Agent, an agentic AI platform that combines PCB and advanced packaging planning, design, simulation, and optimisation in a unified workflow. It uses multiple AI agents to automate tasks including layout, place-and-route, constraint management, design-for-manufacturing, and sign-off. The platform also integrates electrical, thermal, and mechanical analysis, enabling engineers to identify signal and power integrity, thermal, stress, vibration, and reliability issues earlier.
