

Nvidia Blackwell GPUs and CUDA-X libraries, AuraStack targets complex designs for AI infrastructure, data centres, automotive, aerospace, and other high-performance electronics.

NIELIT and SCL bring indigenous PDK to eChipHub

NIELIT and Semiconductor Laboratory (SCL) have integrated an indigenous 1.2µm process design kit (PDK) into the eChipHub platform, giving students, researchers, startups, and industry professionals access to Indian semiconductor process technology. The platform combines the PDK with open source EDA tools for chip design and fabrication workflows, supporting India's semiconductor talent pipeline and indigenous chip-design ecosystem.

ASIP Technologies sets up ₹25 billion OSAT facility in Andhra Pradesh

ASIP Technologies has launched a ₹25 billion semiconductor OSAT facility in Visakhapatnam, the first ISM 1.0-approved semiconductor manufacturing project in Andhra Pradesh and South India. The plant will produce 96 million chips annually, initially using wire-bond and FC-BGA packaging, with 2.5D/3D capabilities planned. It is expected to create 1000+ direct jobs.

Sivers and SemiNex launch \$3.4M InP laser programme for AI data centres

Sivers Semiconductors and SemiNex have launched a \$3.4 million development programme for next-generation indium phosphide (InP) light sources targeting AI data-centre interconnects. The project will develop external lasers for co-packaged optics, DFB laser arrays and SOA gain stages. Customer sampling and initial production are targeted for H2 2027.

AI toolkit accelerates engineering workflows

Nvidia has expanded its Nvidia

Agent Toolkit with PhysicsNeMo and updated CUDA-X libraries, enabling AI engineering agents to perform physics-based reasoning, simulation, and analysis. The toolkit combines physics-informed AI with GPU-accelerated numerical solvers, allowing agents to work with engineering data and generate simulation outputs rather than simply writing code. Key capabilities include AI-assisted RTL coding, sparse linear-system solving, and quantum chemistry computation. Applications span semiconductor design, advanced packaging, PCB development, digital twins, aerospace, automotive, robotics, and scientific research. The approach can reduce manual work and accelerate design and verification cycles.

Samsung delays high-NA EUV adoption for 1.4nm process

Samsung Foundry is delaying its 1.4nm-class SF1.4 process from 2027 to 2029 and will focus on refining its 2nm process family for now. The company said it currently does not plan to use High-NA EUV for 2nm or 1.4nm production, with adoption expected for 1nm-class and smaller nodes around 2030. Samsung cited technology maturity, yield, and cost considerations.

Intel raises \$20 billion to expand chip foundry business

Intel has raised \$20 billion through an enlarged share offering to strengthen its balance sheet and fund the expansion of its contract chip manufacturing operations. The company increased the offering from \$15 billion amid strong investor demand, while raising its 2026 capital expenditure forecast to \$20 billion as it expands advanced manufacturing and packaging.

AI design tools for faster 2nm chip development

Rapidus Corporation has introduced a suite of AI-powered semiconductor design tools under its Rapid and Unified Manufacturing Service (RUMS)

IN ADDITION

- Paras Semiconductors to set up ₹62 billion OSAT facility in Madhya Pradesh
- Silanna unifies semiconductor and UV businesses under a single brand
- Nokia to acquire NXP's Arizona Fab for AI optical chips

framework to accelerate development for its 2nm process technology. The first releases, Raads Generator and Raads Predictor, automate RTL generation and optimise power, performance, and area during early design stages. Targeting ASIC, SoC, and semiconductor design teams, the tools streamline chip development, reduce manual effort, and improve design quality. Additional AI-driven applications support verification, layout, quality assurance, and physical design, enabling faster and more efficient advanced semiconductor development.

Sony and TSMC plan \$6.3 billion image sensor venture

Sony and TSMC are reportedly planning a \$6.3 billion joint venture in Japan's Kumamoto prefecture to manufacture next-generation image sensors. Sony is expected to hold 60% and TSMC 40%, with production potentially starting in 2029. The partnership aims to advance sensor technologies for smartphones, automobiles, robotics, and physical AI.

Lam Research and NY CREATES to train 3500 students in semiconductor processes

Lam Research and NY CREATES will train about 3500 university students over five years in semiconductor process integration using Lam's SEMulator3D virtual fabrication software. The programme will cover advanced chip manufacturing processes and address the industry's skills gap. Separately, Lam plans to invest over \$3 billion in R&D laboratories globally to expand experimentation and accelerate technology development.
