

HTR Resistors for Electric Mobility

The Components Your EV Systems Depend On

HBR

HMR

HCL

Customised HEB

Precision Resistors | Reliable and Durable | Distribution across 50+ countries

EV Charging Systems

Fast charging puts real stress on electronic components. HTR resistors handle it, delivering consistent performance across 2W, 3W, and 4W charging applications. Designed for high-heat conditions and precise current control, they stay stable where fluctuating loads and thermal stress are a constant.

EV Battery Management Systems

A battery pack performs only as well as the components monitoring it. HTR's precision shunt resistors give your BMS the accurate, stable current measurements it needs to track State of Charge, assess battery health, and protect the pack over its operating life. AEC-Q200 qualified and ISO 26262 compatible, built for production-scale automotive programs.

**Powering electric mobility,
one precision component at a time.**
