## ANIMALS IN DANGER

Southern three-banded armadillo

⚠ IUCN status: near threatened

📊 Population estimate: unknown

Giant armadillo

⚠ IUCN status: vulnerable

📊 Population estimate: unknown

## Burrowing down

All armadillos are burrowers, and use their strong clawed feet to dig tunnels with sleeping chambers. Most species spend much of the day in their burrows to avoid the heat of the sun or to hide from large predators, such as pumas.

## Giant armadillo

The Amazon Basin is home to the biggest species of armadillo. The 130-lb (60-kg) giant armadillo lives in undisturbed tropical forests. It is hunted for its meat and threatened by deforestation.

ATLANTIC OCEAN

Amazon

SOUTH AMERICA

Andes

Gran Chaco

## Hairy long-nosed armadillo

This armadillo's armor is covered with hair. It lives in the remote cloud forests of the Andes Mountains.

## Rolled up

Only three-banded armadillos can roll into a ball and pull their limbs inside when threatened.

## Southern three-banded armadillo

This species is found in drier habitats than most other armadillos. It lives in the thorny forest, scrub, and savanna of the Gran Chaco—a wide grassy area in central South America.

## Pink fairy armadillo

The mole-like pink fairy armadillo is the smallest armadillo species. Its body ends with a vertical rump plate, which it uses to compact sand in burrows or even seal their entrance when danger threatens.
