

Six species of badgers live across North America, Africa, and Eurasia—and all are stocky, strong-bodied animals. The honey badger has a particular reputation for toughness. With a strong bite, thick skin, and sharp claws, it is a fierce hunter that braves stinging bees to satisfy its taste for honey.

## Digging for prey

As well as excavating burrows, the strong front paws with their long claws can rip open bee hives and dig out animal prey such as rodents from underground. Food is found by smell and sound.
