

*Coelacanths were thought to have died out with the dinosaurs, but were rediscovered in 1938.*

*Lungfish can survive for months in dry conditions when sealed up in mud cocoons.*

*The skeleton of the stellate sturgeon is part bone, part cartilage. People eat its eggs as caviar.*

*The eyes of deep-ocean-dwelling hatchetfish point upward to spot prey overhead.*

*The blue ribbon eel buries itself in sand or hides behind rocks, dashing out to feed on small fish.*

*Sea horses mate for life. The male carries eggs in his brood pouch until they hatch.*

*The blind cave fish has no eyes, but it is able to navigate the dark waters in deep Mexican caves.*

*Atlantic herring swim in huge shoals, often numbering hundreds of thousands.*

*The fanfin anglerfish uses a bulbous stalk over its head as bait to lure prey.*

*Sockeye salmon swim from ocean to river to lay eggs, or spawn.*

*The rosy-lipped batfish uses its fins like legs to crawl around the ocean floor.*

*The tailbar lionfish uses its long, poisonous spines for defense.*

*Porcupinefish warn off potential predators by inflating their bodies with water.*

*The colorful moorish idol uses its long snout to reach morsels of food in crevices in coral reefs.*

*The leafy sea dragon has leaflike protrusions all over its body, disguising it as seaweed.*

*Hairy frogfish sit on the ocean floor waiting to suck passing prey into their cavernous mouths.*
